11. Support

SAP Business One	10.0 or later, with the Service Layer
Database	Microsoft SQL Server or SAP HANA (on SAP HANA a test during installation is recommended)
System	Windows 10 and 11, Windows Server 2016 and later, 64-bit; Microsoft Edge WebView2 Runtime
Program languages	Italian, English, German, French, Spanish, Turkish

1. What it does

XEI Rate Updater for SAP Business One updates the **currency exchange rates** in SAP Business One with the rates published by an official source:

1. it takes the rates of the chosen **source** for the requested date;
2. it reads from the SAP company the **local currency** and the **direction** of the exchange rates: direct rate (local currency per one unit of foreign currency) or indirect rate (foreign currency per one unit of local currency);
3. if the local currency is not the euro, it calculates the **cross rates** against it;
4. for each **currency managed by the company** it writes to SAP the exchange rate for the date, in the company's direction, truncated to six decimals;
5. it saves the run in the **history**.

An error on one currency does not stop the others.

The date of the rates

The rates of a day are published at the end of the day. For the SAP exchange rates of a day, the rates published **the day before** are therefore used. On days without publication (weekends, holidays) the latest day published before applies.

Example: the exchange rates of Monday 24 February 2025 are the rates of Friday 21 February. The date of the exchange rates cannot be in the future.

The rate sources

Source	Notes
European Central Bank (ECB)	default, free, no key
Bank of Italy	official Italian exchange rates, many currencies
Open Exchange Rates	requires an Open Exchange Rates API key (Settings › Exchange rates)

All sources publish the rates against the euro. With a local currency other than the euro, the source must quote it.

The currencies

The program recognizes currencies by their **ISO code** (for example `USD`, `CHF`). In SAP, foreign currencies must use the ISO code as their code. For the local currency, if it has another code in SAP (for example "Eu" or "€" for the euro), enter the ISO code in *Settings › Exchange rates*.

2. Installation

1. Extract the folder from the zip file to the PC, for example to `C:\XEI\RateUpdater`.
2. Start **XEI.RateUpdater.exe**. The program already contains .NET. It requires **Microsoft Edge WebView2 Runtime**, which is usually already there: if it is missing, the program says so and offers to download it.

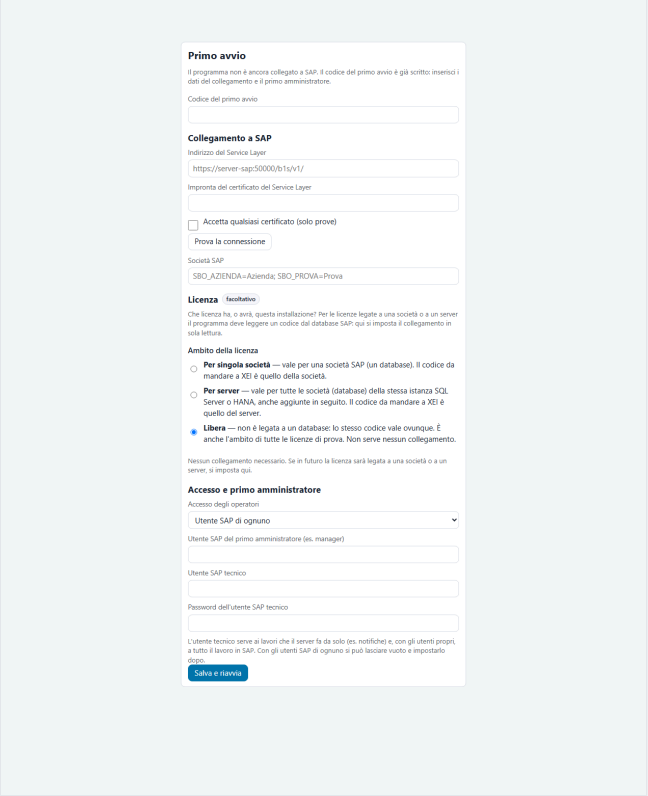

The program has no setup. Settings and history are stored in the Windows data folder of all users of the PC, so they apply to anyone who uses the program on that PC and to the scheduled update.

3. First start

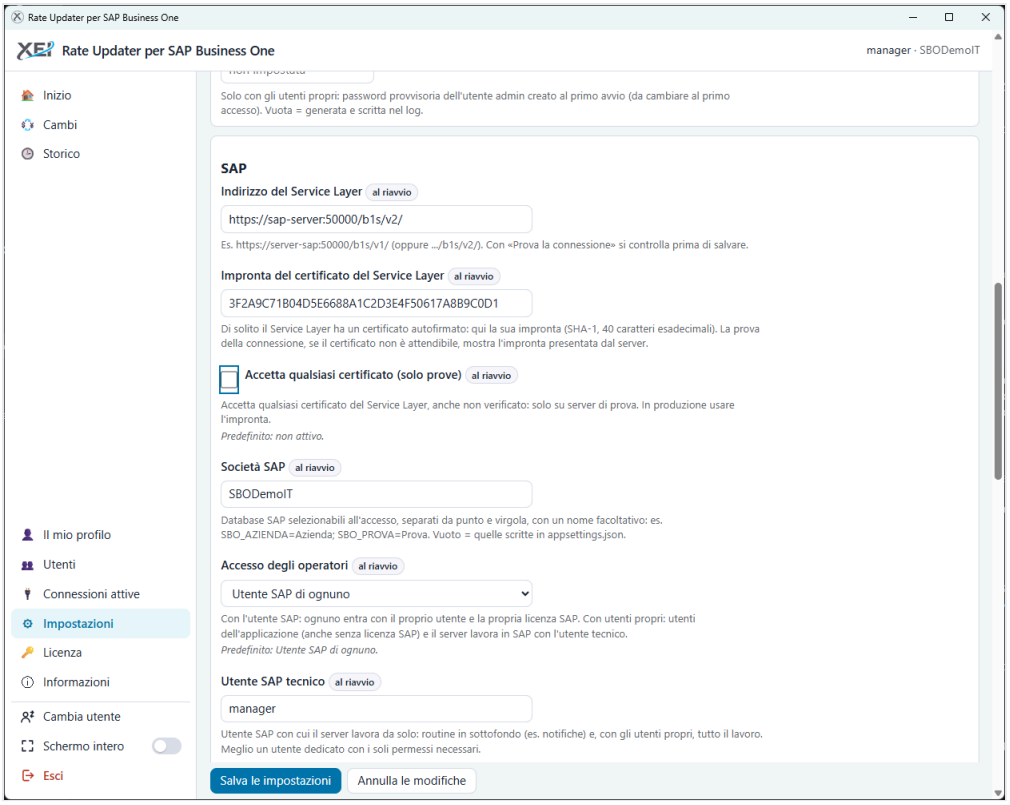

When it opens for the first time, the program shows the **First start** page: it is not connected to SAP yet. The first-start code is already filled in.

1. **SAP connection**:
   - *Service Layer address*;
   - *SAP companies*: the databases that can be selected at sign-in;
   - **Test the connection**.
2. **Sign-in and first administrator**:
   - *Operator sign-in*: **Each person's SAP user** (everyone signs in with their own SAP user) or **Own users and technical SAP user**;
   - *SAP user of the first administrator* (for example `manager`);
   - *Technical SAP user* and its password: they are needed for the **automatic update**. A dedicated user is best, with only the permission to write exchange rates.
3. **Save and restart**: the program reopens on the sign-in page.

The same settings can be changed later in **Settings › SAP**.

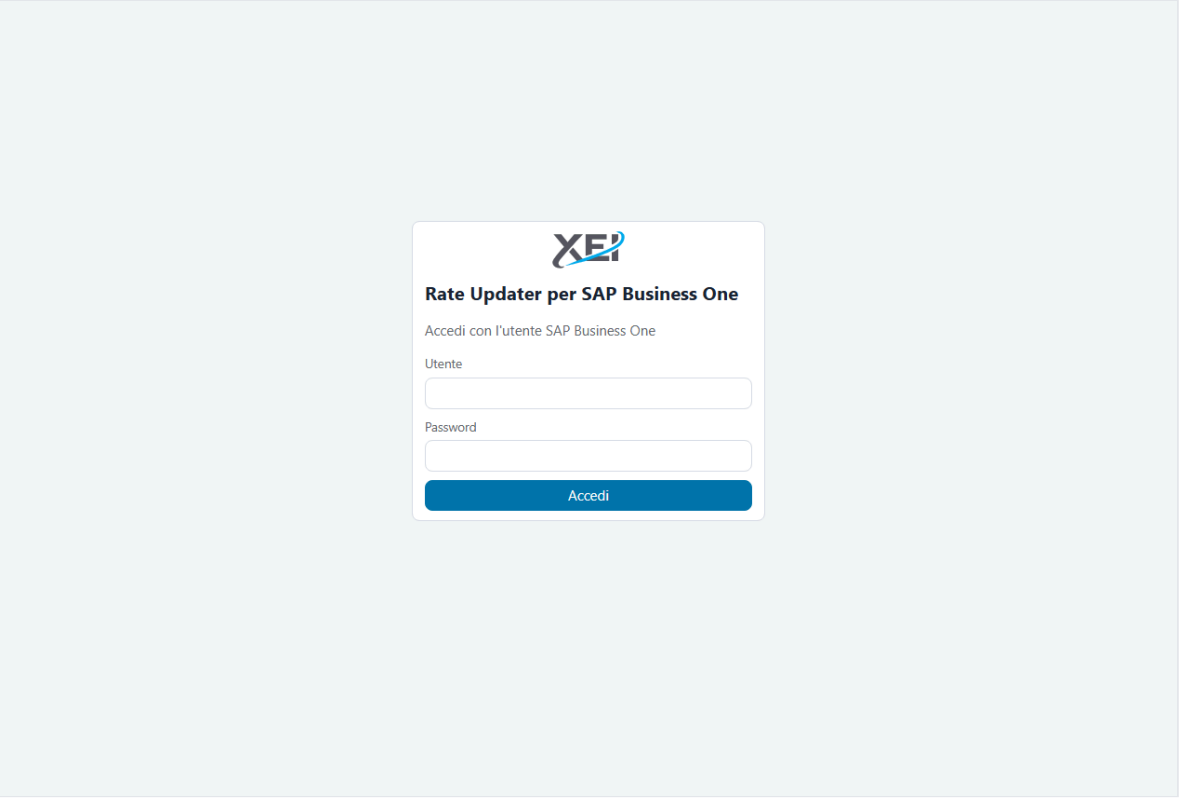

First start: SAP connection, license scope and first administrator.

Settings › SAP: Service Layer address, companies and operator sign-in.

4. Sign-in

You sign in with your **SAP Business One user** and its password. The user and the company are shown at the top right.

Sign-in with the SAP Business One user.

With *Each person's SAP user* the program writes the exchange rates with the user who is working: their SAP authorizations on exchange rates apply.

User functions

An administrator assigns the functions to each user from the **Users** page of the menu, the same for SAP users and for own users:

Function	What it allows
Exchange rate update	updating the exchange rates in SAP from the Exchange rates page
History	viewing the update runs, manual and automatic

The administrator has all functions. The first administrator is the SAP user entered on the First start page.

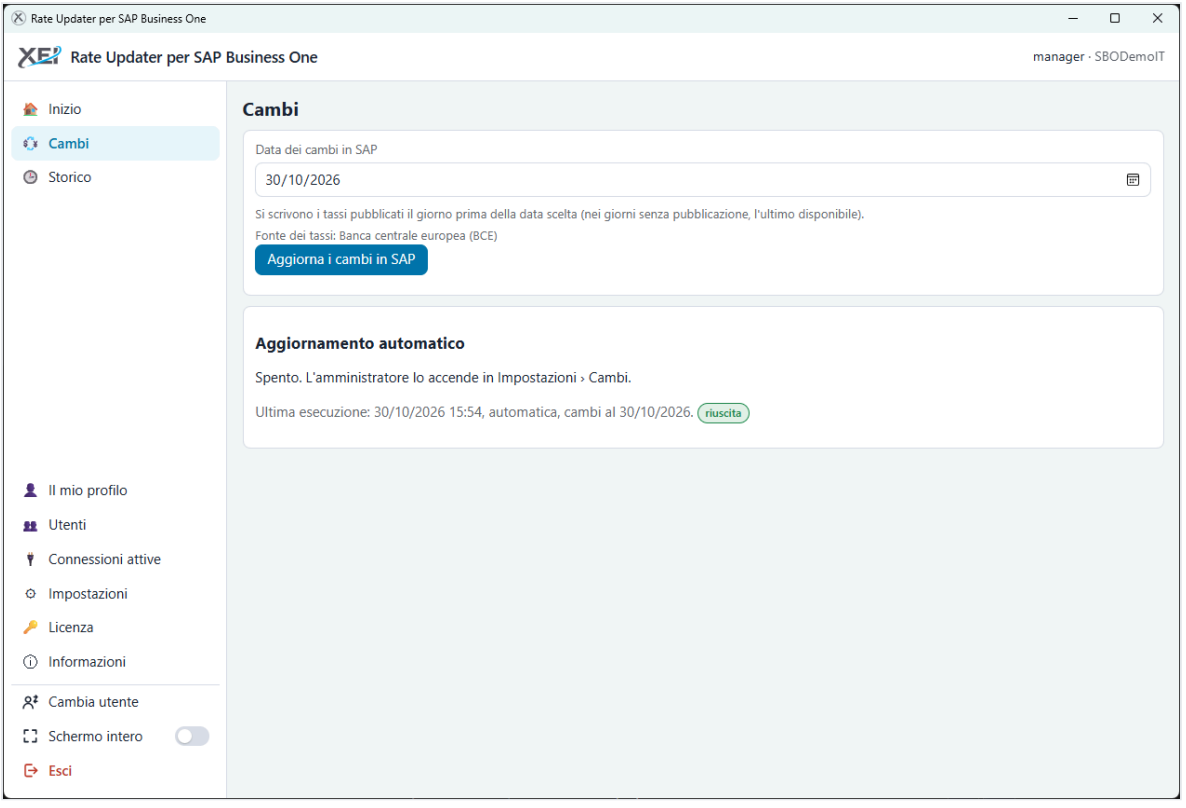

5. Exchange rates

Exchange rates menu.

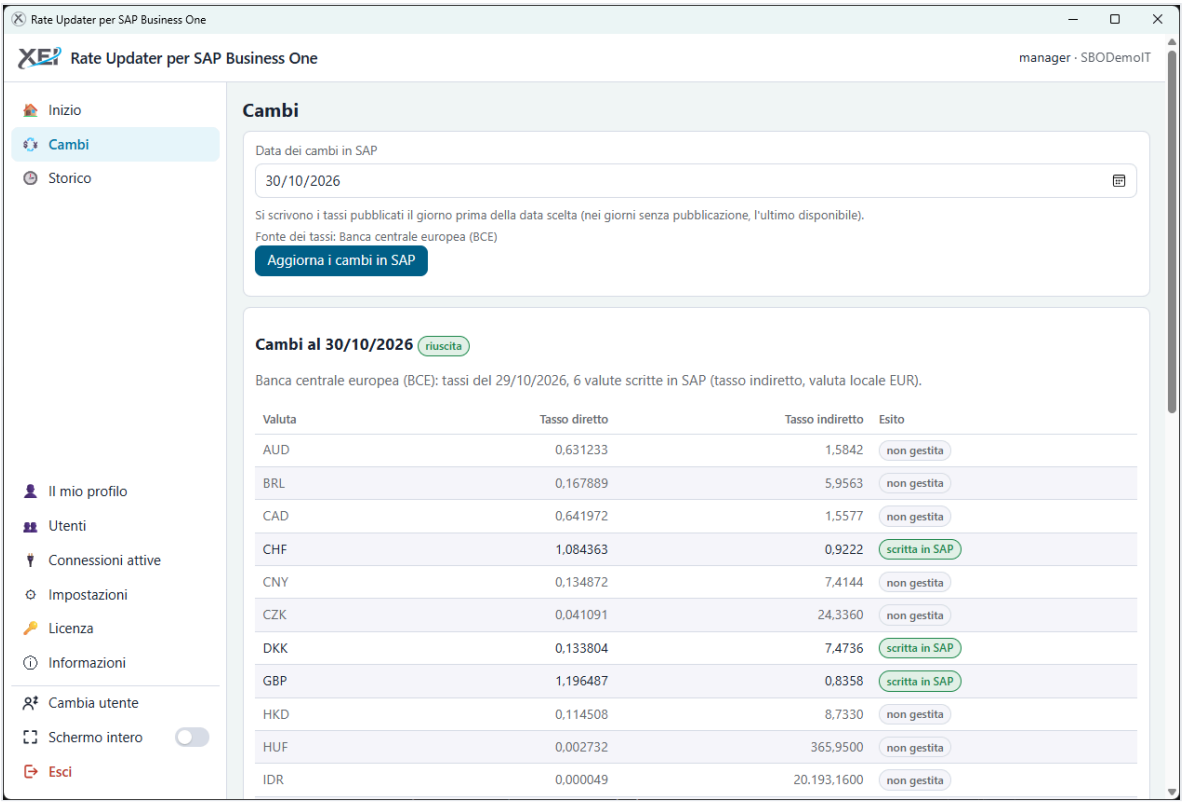

1. **Date of the exchange rates in SAP**: it starts from today and cannot be in the future. Below it you can read which rates are used and the configured source.
2. Press **Update the exchange rates in SAP**.
3. The **outcome** shows the date, the source, the day of the rates, how many currencies were written and the local currency. The table shows for each currency of the source:

Column	What it shows
Currency	ISO code
Direct rate	local currency per one unit of foreign currency
Indirect rate	foreign currency per one unit of local currency
Outcome	**written to SAP**, **not managed** (the company does not use this currency) or refused, with the SAP error

Below is the status of the **automatic update**, with the last run.

Exchange rates: date, source and status of the automatic update.

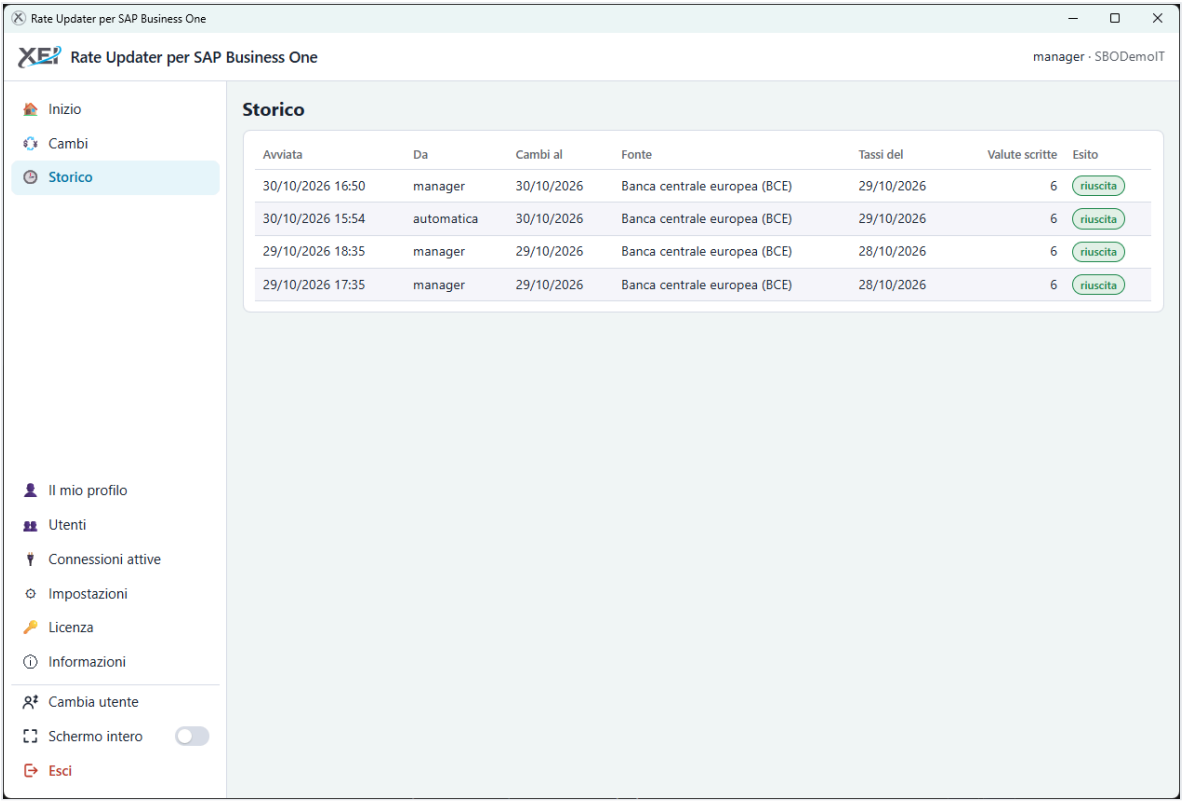

Outcome: rates of the source, currencies written to SAP and currencies that the company does not manage.

6. History

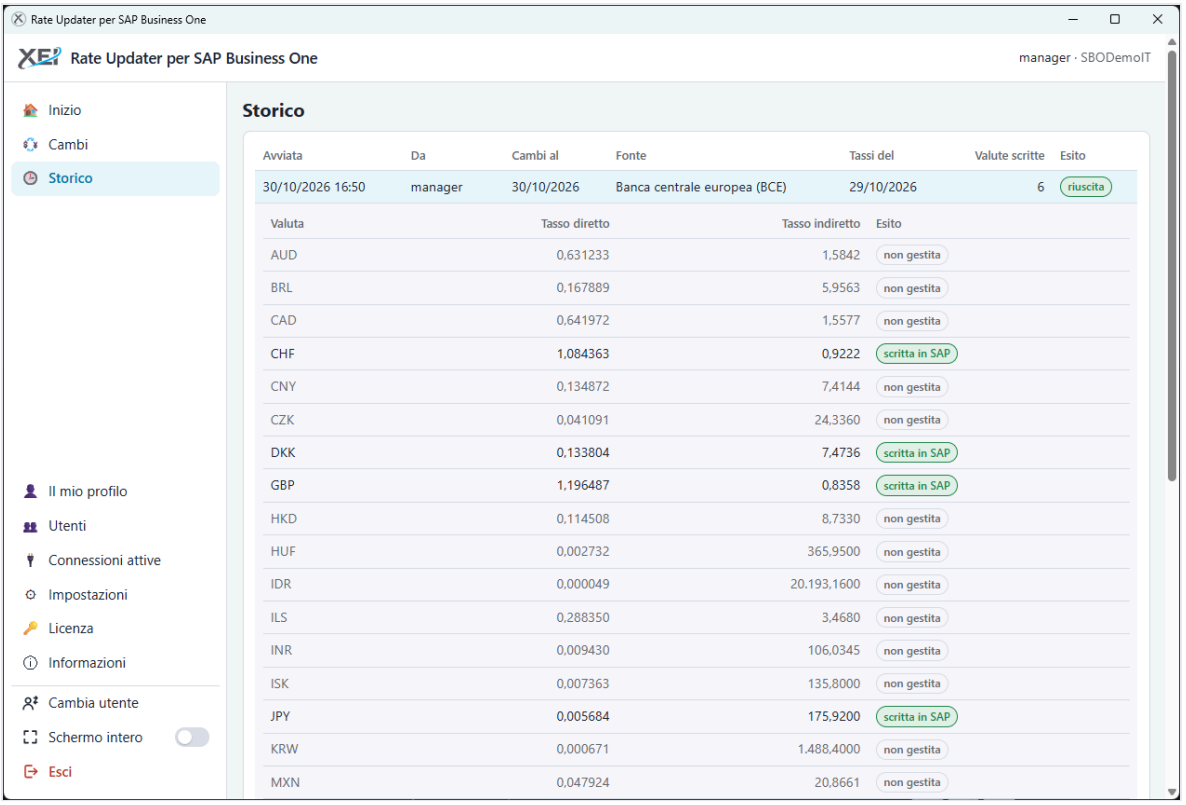

History menu: the company's runs, most recent first.

Column	What it shows
Started	date and time of the run
By	the user, or *automatic*
Rates as of	the date of the exchange rates in SAP
Source	the rate source
Rates published on	the day of the rates used
Currencies written	how many currencies were written to SAP
Outcome	**succeeded** or **failed**

A row opens on the currencies, with the rates and the outcome of each one. The history keeps the latest runs (100 by default, in *Settings › Exchange rates*).

History: manual and automatic updates of the company.

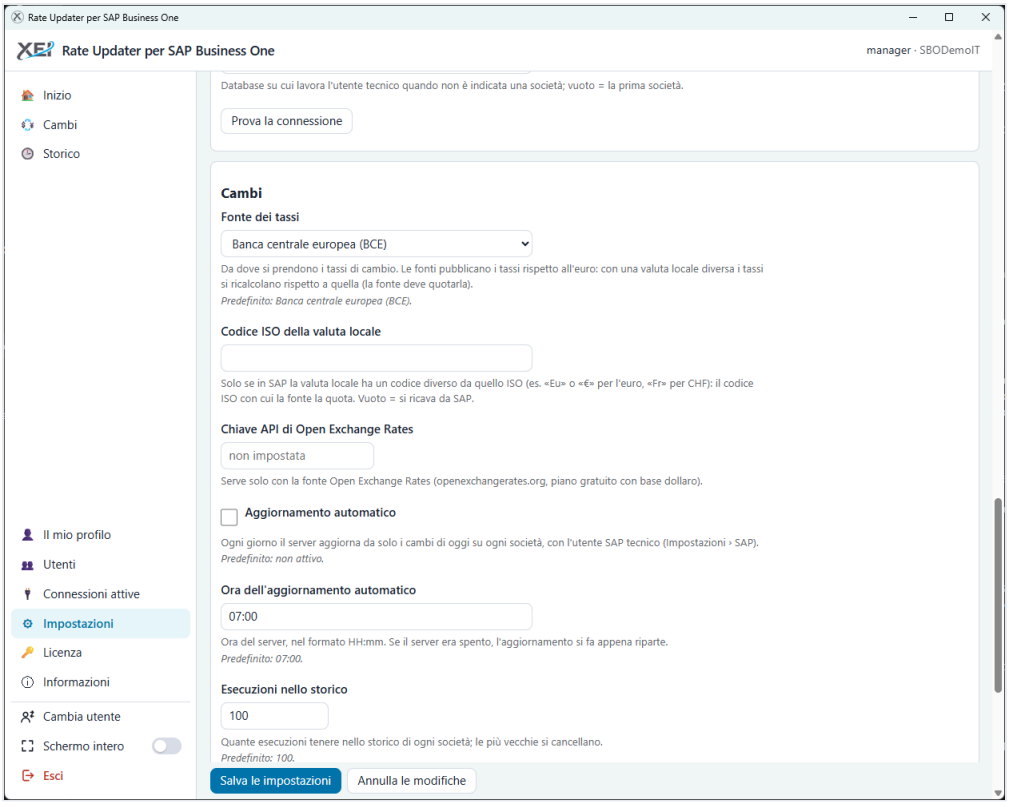

An open row: rates and outcome of each currency.

7. Settings › Exchange rates

For administrators only. After making changes press **Save settings**.

Setting	What it does
Rate source	European Central Bank (default), Bank of Italy or Open Exchange Rates
ISO code of the local currency	only if in SAP the local currency has a code other than the ISO one; empty = taken from SAP
Open Exchange Rates API key	only with the Open Exchange Rates source; stored encrypted
Automatic update	every day the program updates today's exchange rates of each company on its own, with the technical SAP user
Automatic update time	in HH:mm format (default 07:00)
Runs kept in the history	how many runs to keep for each company, from 10 to 1000 (default 100)

Settings › Exchange rates: source, local currency, automatic update and history.

8. Automatic update

Today's exchange rates are updated every day in two ways.

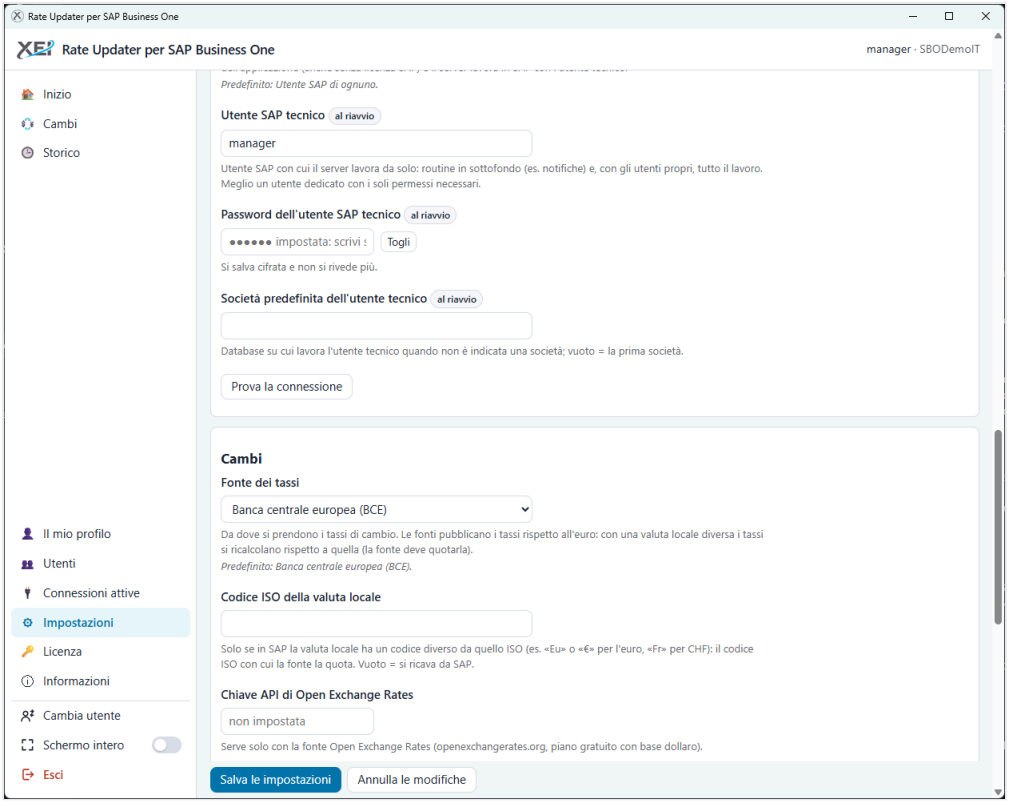

With the program open

With **Automatic update** turned on, once the set time has passed the program updates today's exchange rates of each company with the technical SAP user and saves the run in the history (*By*: automatic). If the program was closed at the set time, it updates as soon as it is reopened. If the source or SAP does not respond, it tries again shortly after.

With the Windows Task Scheduler

This way the exchange rates are updated even without opening the program.

1. Complete the first start and set the **technical SAP user** (Settings › SAP).

The technical SAP user in Settings › SAP.

2. In Windows open **Task Scheduler** and create a basic task, for example every day at 7:00.
3. As the action choose **Start a program**:
    - program: `XEI.RateUpdater.exe` in the program folder;
    - arguments: `aggiorna`.
4. In the task properties choose **Run whether user is logged on or not**, with a Windows user of the PC.

The command updates today's exchange rates with the technical SAP user and closes, without a window. It uses the same settings and the same history as the program. Optional arguments:

Argument	Meaning
`--societa <database SAP>`	the company (SAP database) to update; not needed with only one company configured
`--data aaaa-mm-gg`	the date of the exchange rates (year-month-day), if it is not today

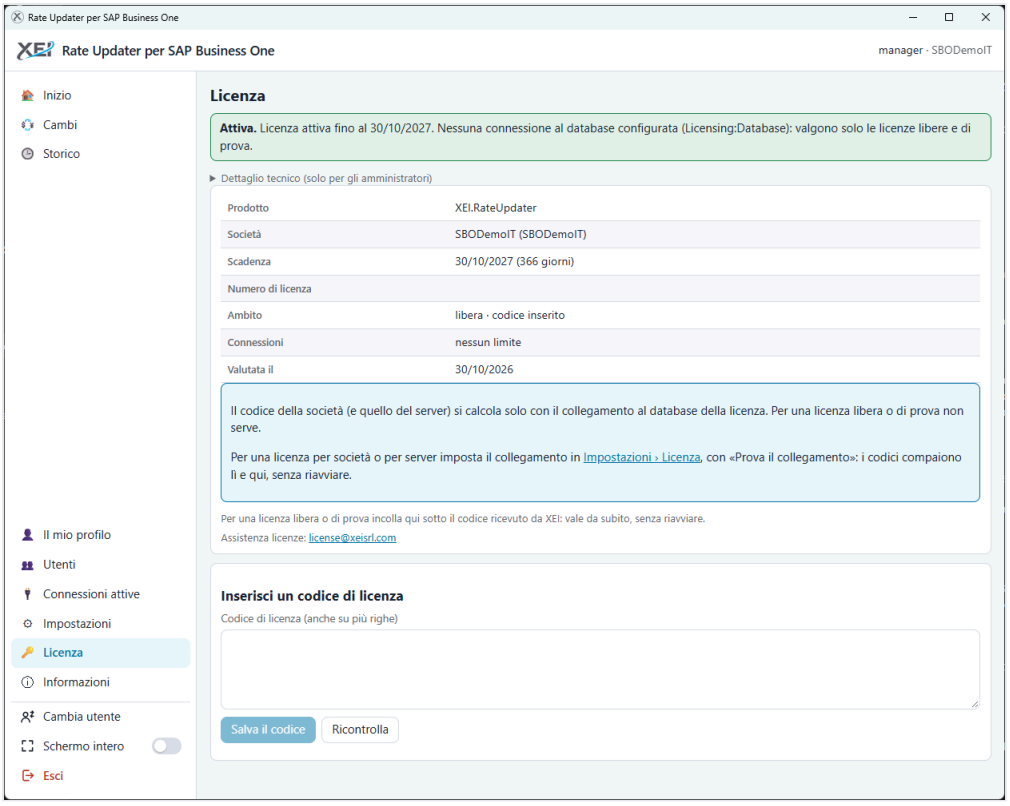

Task Scheduler receives the result: **0** succeeded, **1** failed or with a refused currency, **2** wrong arguments. The details are in the history. If the command has already updated today's exchange rates, the open program does not update them again.

9. License

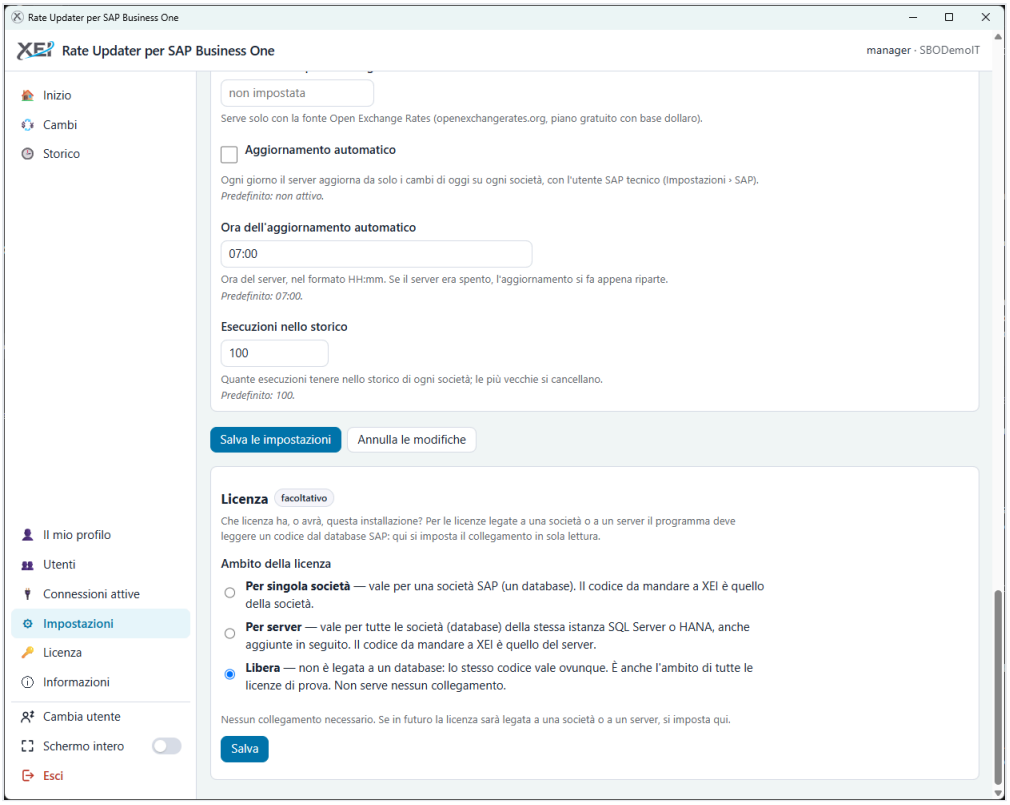

The program works with a **license code** issued by XEI, in three scopes:

Scope	Applies to
Single company	one SAP database
Server	all the companies of the SQL Server or SAP HANA instance
Free	not tied to a database

The **free trial** lasts 30 days, with the scope Free.

The License page: status, expiry, scope and field for the code.

Settings › License: the three license scopes.

License menu: status, expiry and scope of the license. Paste the code received from XEI into **Enter a license code**: it takes effect immediately, without restarting. For a per-company or per-server license the program must be connected, read-only, to the license database (*Settings › License*, **Test connection**): the company and server codes to send to XEI appear there and on the License page.

For licenses: license@xeisrl.com.

10. Frequently asked questions and problems

What you see	Why	What to do
A currency is *not managed*	The SAP company does not use that currency	Nothing: only the company's currencies are written
A currency of the company is not updated	In SAP the currency does not use the ISO code as its code	Use the ISO code in SAP (for example `USD`)
The run stops immediately with an error on the local currency	The source does not quote the local currency, or in SAP it has a non-ISO code	Enter the ISO code in *Settings* › *Exchange rates* or choose another source
The outcome of a currency is an SAP error	SAP refused the exchange rate (for example because of the user's authorizations)	Read the error; check the user's SAP authorizations on exchange rates
The automatic update does not start	It is turned off, or the technical SAP user is missing	Turn it on in *Settings* › *Exchange rates* and set the technical user in *Settings* › *SAP*
The program asks to install WebView2	Microsoft Edge WebView2 Runtime is missing	Accept the suggested download, or install it from the Microsoft website

11. Support

For licenses: license@xeisrl.com. For support: info@xeisrl.com. In your request, state the program version (*About* menu) and describe the problem.
