Installation, license and menus are also described in the installation guide.

1. What the add-on does

XEI.ContoLavoro manages the processing entrusted to **subcontractors** (outside suppliers) who receive components from the company, process them and return a finished or semi-finished product. For each processing job a **Subcontracting Job** is opened that keeps together:

- the **products** to be obtained, with their bill of materials (components to ship and processing to pay for);
- the **purchase order** to the subcontractor, automatically aligned with the Subcontracting Job;
- the **component shipments** to the subcontractor's warehouse, the **returns** and the **scrap**;
- the **receipt** of the products: goods receipt of products and processing, goods issue of the consumed components, receipt from production for products that come from a production order (chapter 6);
- the real-time situation: how much has been shipped and used, what remains at the subcontractor and what is missing.

The Subcontracting Job closes by itself when all products have been received and no components remain at the subcontractor.

Highlights

- Header like an inventory transfer, with warehouses propagated to the rows and the subcontractor warehouse protected after the first movements.
- Batches and serial numbers chosen in the add-on: proposal from the Subcontracting Job's batches at the subcontractor (traceability) and FEFO, editable by hand; batch of the incoming product from a configurable SQL script; product receipt in a single transaction.
- Documents folder with all linked documents, grouped and ready to open.
- Product costs recalculated at every save; purchase order aligned automatically.
- Subcontracting Jobs from production orders, mass transfer and transfer between jobs, mass closing of goods receipts.
- Same behavior on SQL Server and SAP HANA; translatable texts.

2. Installation and menus

Installation

- The `XEI.ContoLavoro.zip` package is imported in the Extension Manager of SAP Business One.
- On first start the add-on creates tables, fields, the object (UDO) `XEI_CL_COMMESSA` and the formatted search of the subcontractor vendor on the warehouse. SAP asks you to confirm that *"the database structure has been modified"*: answer and wait for it to finish before using the client.
- Before creating jobs, define the **numbering series** of the Subcontracting Job, as for SAP documents: **Modules › Administration › System Initialization › Document Numbering**, item *Commessa terzista* (Subcontracting Job) at the bottom of the list. Without a series, when you open *Subcontracting Job* the add-on tells you to define it.

Menus

Modules › Administration › Add-Ons › XEI-Addon › Subcontracting:

Item	Function
Subcontracting Job	opening, search and creation of Subcontracting Jobs
Create Jobs from Production Orders	Subcontracting Jobs from the external processing of production orders (chapter 6)
Receipt from Subcontractor	a subcontractor's delivery note with products of several Subcontracting Jobs: you choose the vendor, enter the quantities received on the open products of its Subcontracting Jobs (*Propose* = open quantity) and *Post* performs the product receipt job by job, with receipt of the products and issue of the components
Mass Component Transfer	shipment of components for several Subcontracting Jobs (can be disabled in Configuration, chapter 3)
Component Transfer Between Jobs	moves the stock already at the subcontractor from one Subcontracting Job to another
Mass Closing of Product Goods Receipts	closes the goods receipts of the products that are still open
Subcontractor Processing Prices	processing prices by vendor and product
Configuration	options of the add-on
Informazioni (About), Traduzioni (Translations), Licenza (License)	items common to the XEI add-ons; Licenza: status and license code

The same items, except *Configuration*, *Informazioni*, *Traduzioni* and *Licenza*, are also in the SAP module chosen in Configuration (chapter 3), in the chosen position: **Modules › Purchasing › Subcontracting** (default) or **Modules › Production › Subcontracting**.

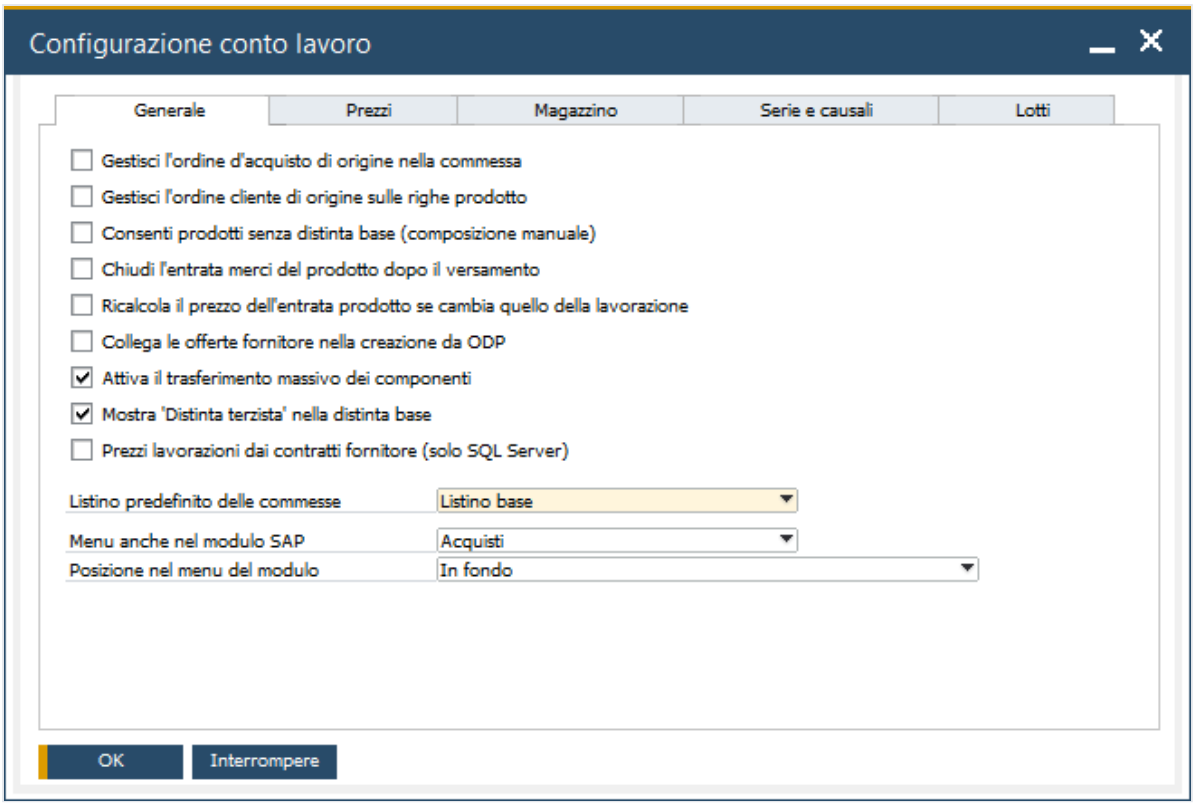

License

The add-on works with a **license code** issued by XEI. After requesting the trial you receive by email a **trial code**, valid for 30 days from sending in any company; to purchase, you send XEI the two codes of the **Licenza** (License) window and receive the license code.

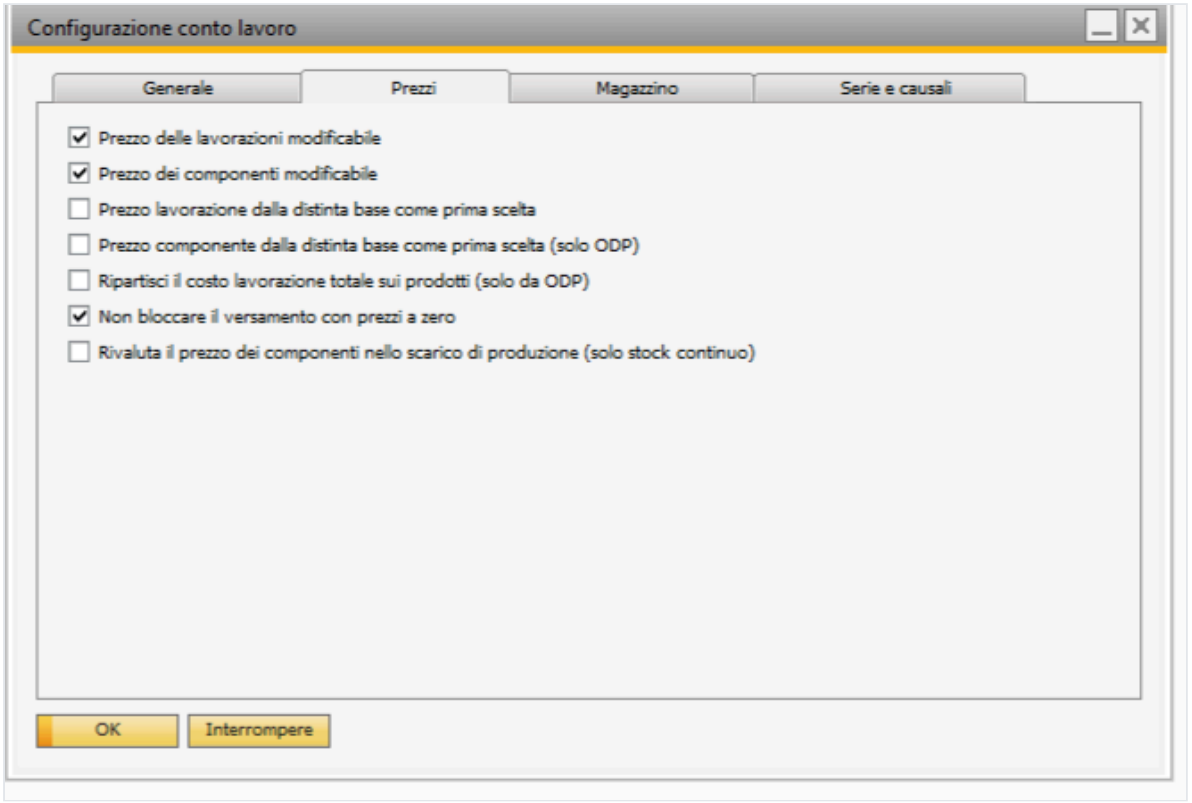

- Without a valid code the add-on is **locked**: its menu contains only *Informazioni* (About) and *Licenza* (License), and at startup the **Licenza** window opens by itself with the status and the reason.
- The window shows the **company code** and the **server code**: to purchase the license, with *Copia* (Copy) you send them to license@xeisrl.com.
- An SAP **superuser** pastes the code received into *Inserisci un codice di licenza* (Enter a license code) and presses *Salva codice* (Save code): the add-on is unlocked immediately, without restarting SAP.
- The license code is valid for the company (database) or for the server of the codes sent.
- The same window opens at any time from the *Licenza* menu: status, expiry date, number and scope of the license.

3. Configuration

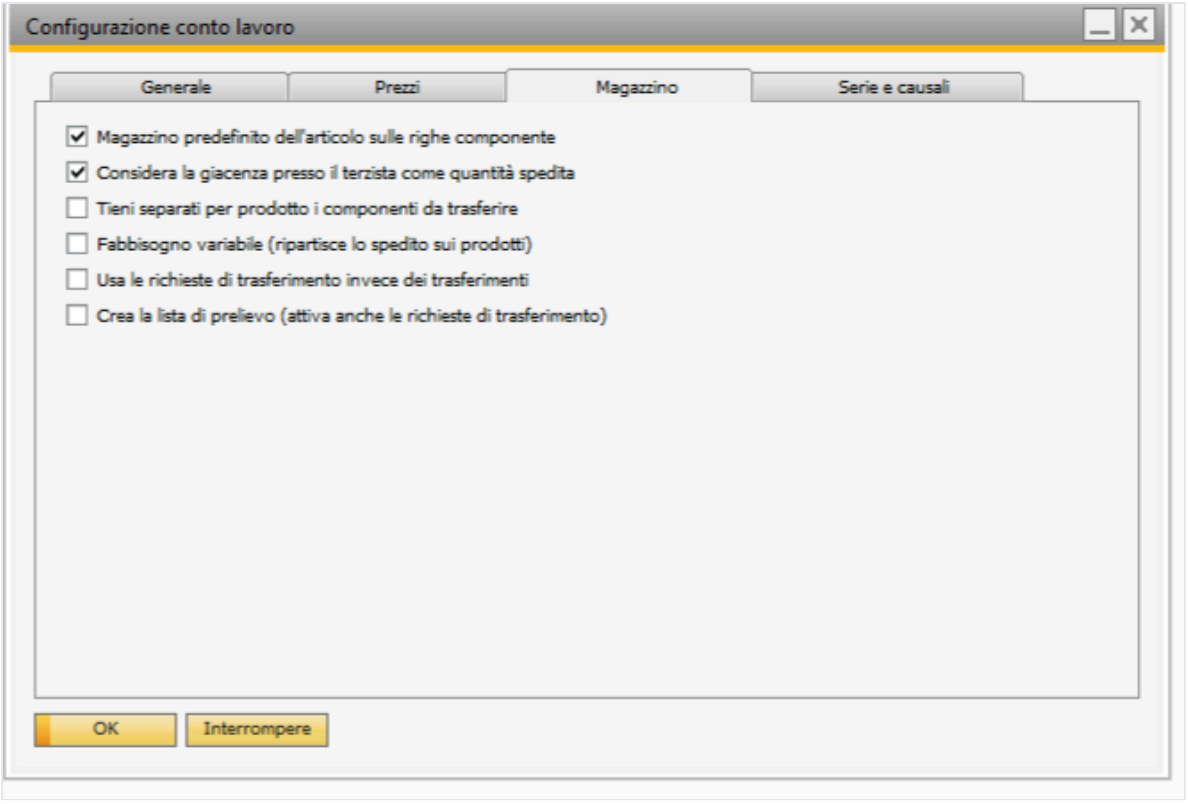

The options are set in a form with folders (the *Batches* folder is described in chapter 7). The options apply to the whole company; forms that are already open use them when they are opened again.

General

Prices

Inventory

Series and Reasons

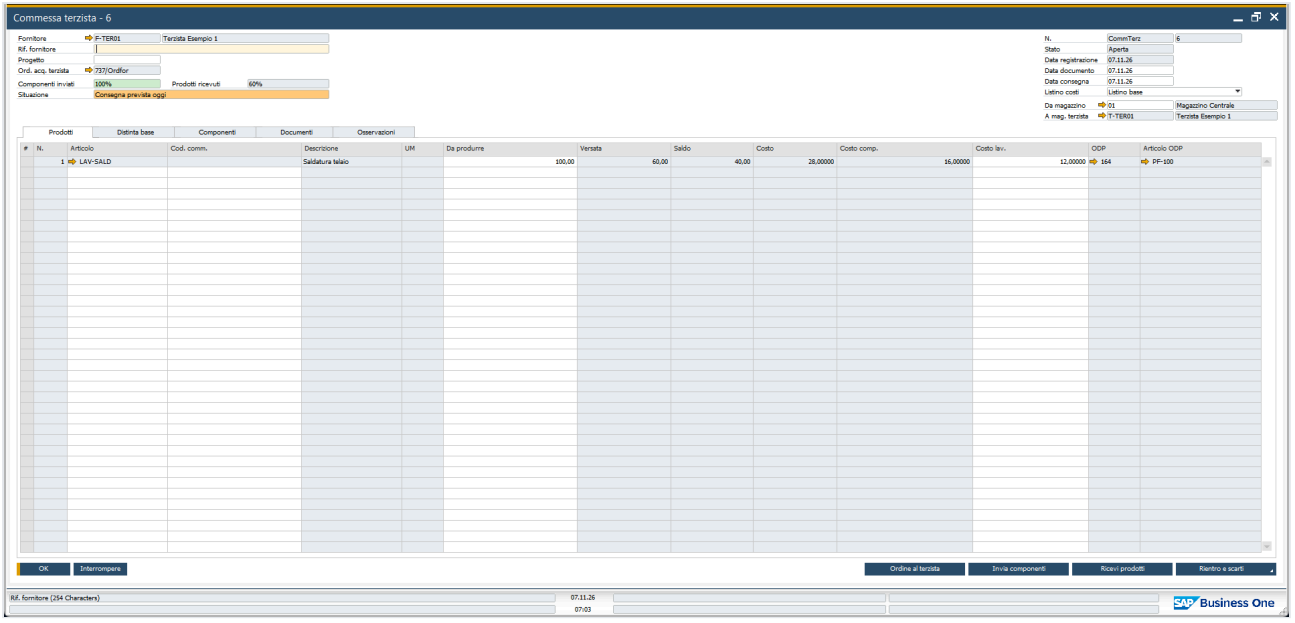

Option	Effect	Default
General		
Source purchase order	field to link the Subcontracting Job to the purchase order it comes from	No
Source sales order	sales order column on the product rows	No
Products without bill of materials	allows products without a bill of materials: it is composed by hand	No
Close the product goods receipt	after the product receipt the goods receipt of the product is closed (it is not invoiced)	No
Recalculate the product goods receipt price	if the processing price changes, updates the goods receipt of the product	No
Vendor quotations from production orders	links the vendor quotations when creating from production orders	No
Mass transfer	allows the mass transfer of components; with No the menu item warns that the function is disabled	Yes
Subcontractor BOM	shows the “Subcontractor BOM” column in the bill of materials	Yes
Vendor agreements	processing prices from the agreements (SQL Server only)	No
Default Price List for Jobs	cost price list proposed on new Subcontracting Jobs; needed to create the Subcontracting Jobs from production orders (chapter 6)	–
Menu Also in SAP Module	module with the *Subcontracting* submenu: Purchasing or Production	Purchasing
Position in Module Menu	at the bottom, at the top or after an item of the module	at the bottom
Prices		
Processing / component price editable	prices editable in the bill of materials of the Subcontracting Job	No
Processing / component price from the bill of materials	the bill of materials price as first choice (component: production orders only)	No

Option	Effect	Default
Split the processing cost	splits the total cost across the products (from production orders only)	No
Do not block with zero prices	the product receipt is allowed even with zero prices	No
Revalue components	revaluation of the components in the production issue (perpetual inventory)	No
Inventory		
Item default warehouse	the component rows start from the item's default warehouse	Yes
Stock as shipped	for the components indicated, the stock at the subcontractor counts as shipped	No
Components per row	components kept separate by product	No
Variable requirement	splits the shipped quantity across the products	No
Transfer requests	component shipment with an inventory transfer request instead of the inventory transfer	No
Pick list	also creates the pick list (enables the requests)	No
Series and Reasons		
Series	purchase order, goods receipts of products and processing, transfers	SAP default
Transport Reasons	for transfers, order, goods receipt, issues, receipts (if the company uses transport reasons)	–
Batches		
Incoming batch script	SQL with {ItemCode}, {WhsCode}, {DocEntry} that returns the batch of the received product (see chapter 7)	job-sequence number

4. The Subcontracting Job

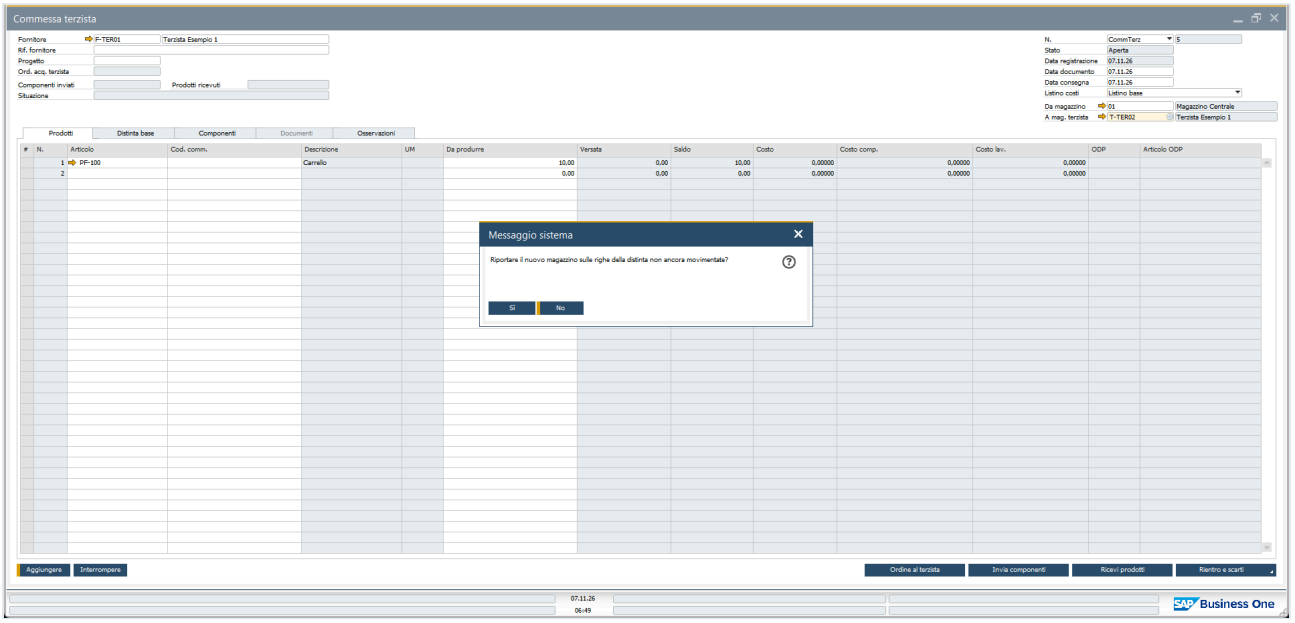

Header

The header is organized like that of the inventory transfer: on the left vendor, vendor reference, project and linked orders; on the right numbering, status, dates, cost price list and the two warehouses.

Subcontracting Job: header and Products tab

- **Vendor**: when chosen, it proposes the user's warehouse and the **subcontractor warehouse** linked to the vendor (*Fornitore terzista* (Subcontractor Vendor) field of the warehouse master data) or the one marked as default.
- **From Whse**: the company's warehouse; the components leave from here, the products come back here and the rows of the purchase order are created on this warehouse.
- **To Subc. Whse**: it can be changed only as long as the Subcontracting Job has no component movements; after that the field is disabled and saving rejects the change anyway.
- When a header warehouse is changed, as in the inventory transfer, you are offered to copy it to the bill of materials rows **that have no movements yet**.

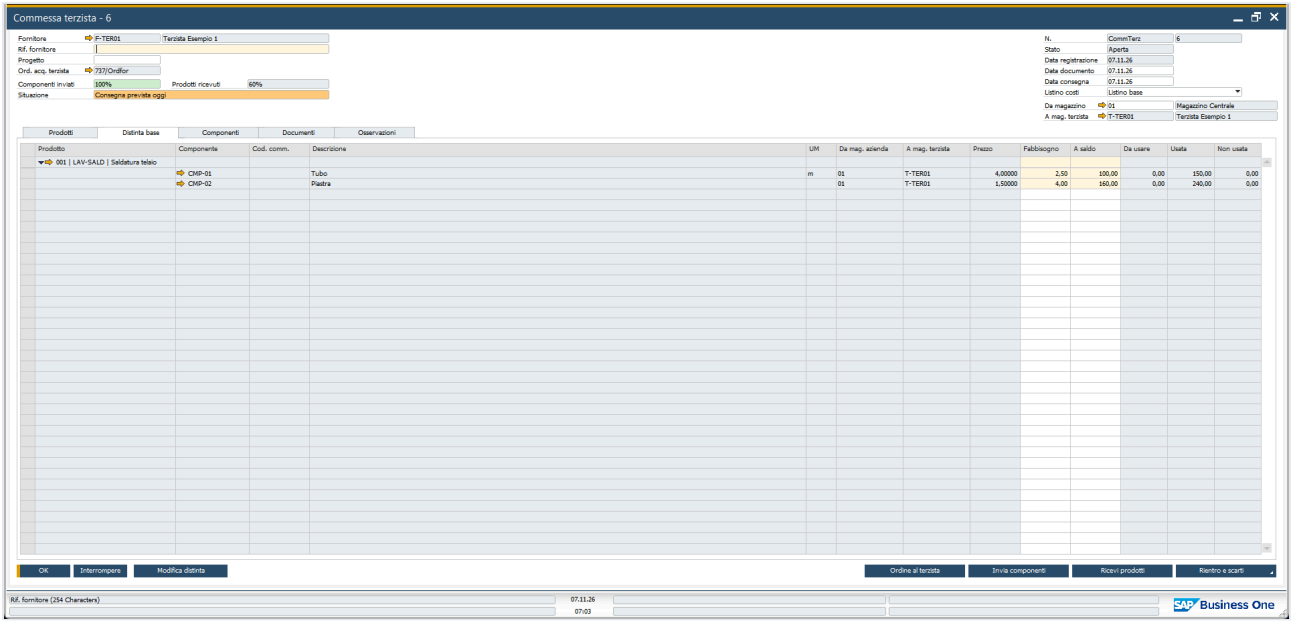

Change of the header warehouse with products already entered

Products

You choose the item (also several items at once from the list) and the quantity to produce: the bill of materials is copied from SAP and scaled to one piece (taking into account the base quantity of the bill of materials). The columns show quantity to produce, received, open quantity, cost of the components and of the processing.

Bill of Materials

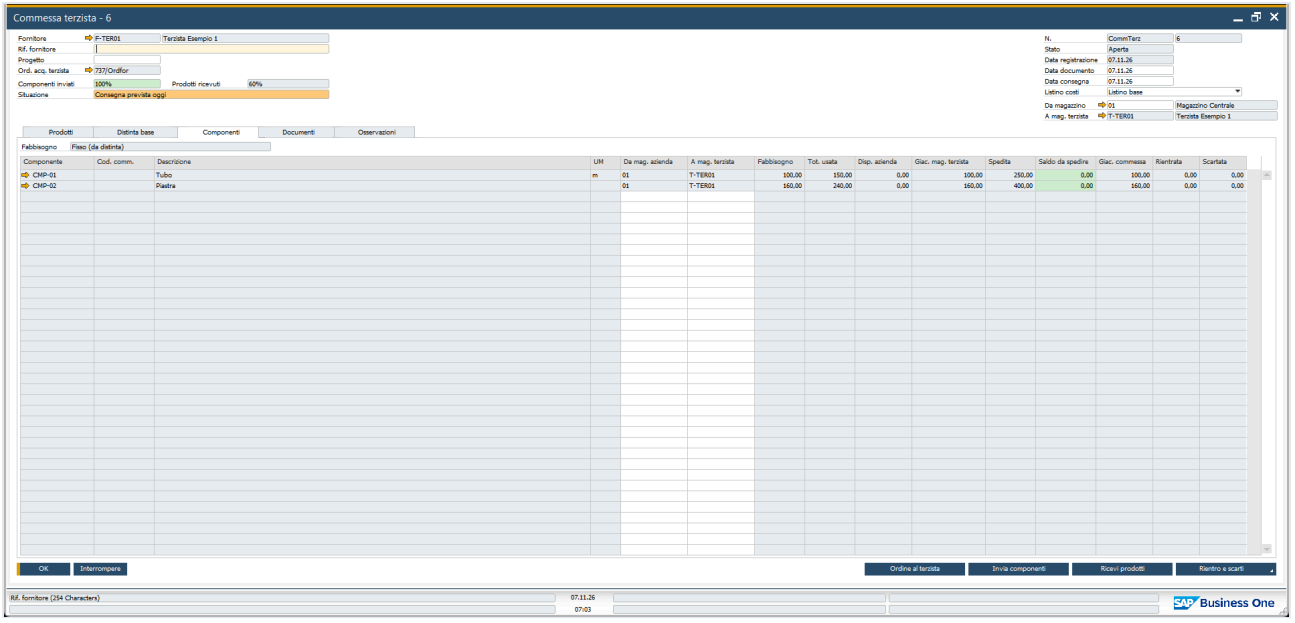

Bill of materials per product: components with warehouses, prices, requirement, used

For each product: components (inventory items to ship) and processing (services paid to the subcontractor). With **Edit Bill of Materials** you change warehouses and prices of the rows that have no movements yet; with SAP's *Add Row* / *Delete Row* you add components and processing or remove those

without movements. From the context menu of the product row: **Rework** (the product goes back to the subcontractor as a component with the new processing) and **Rebuild Bill of Materials** (replaces the bill of materials with the chosen components).

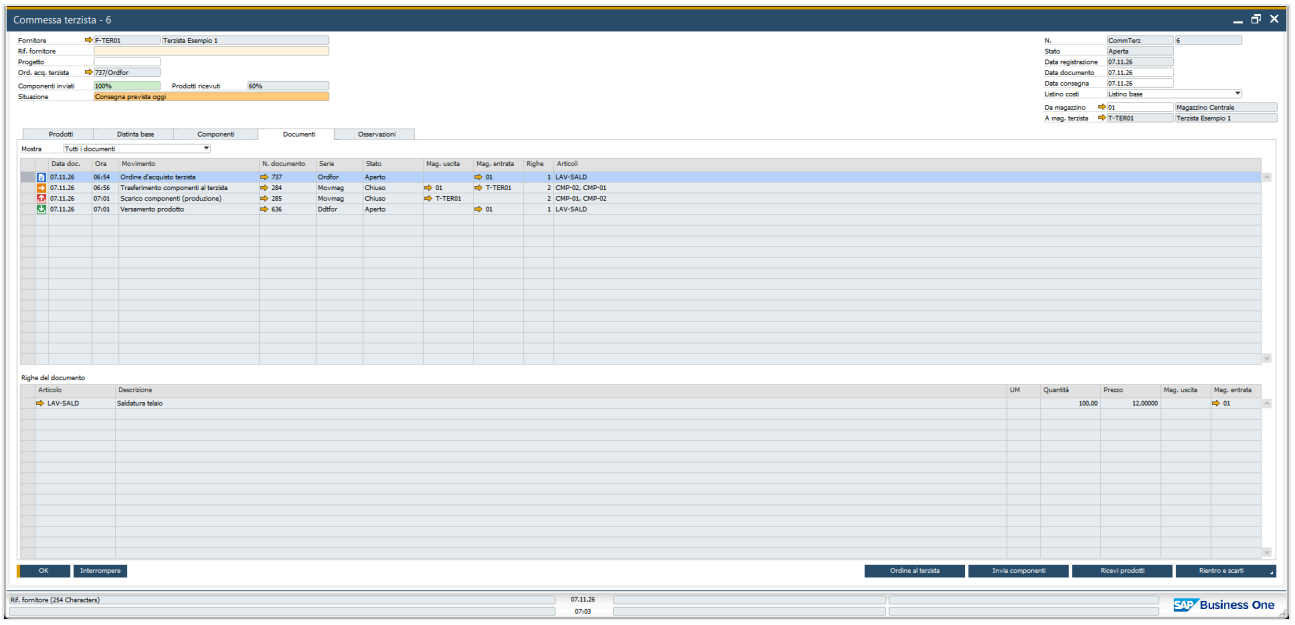

Components

Component status: requirement, shipped, stock and quantity remaining to ship

The components of all products grouped by item and warehouses: requirement, used, available in the company, stock in the subcontractor's warehouse, requests and pick lists, shipped, remaining to ship, stock of the Subcontracting Job at the subcontractor, returns and scrap. Movements are made with the buttons at the bottom of the Subcontracting Job: **Send Components** and **Returns and Scrap** (*Return Components from Subcontractor*, *Transfer Scrap*, *Scrap Issue at Subcontractor*). Each one opens a window with the quantities to move in the yellow cells: *Propose* fills them, *Clear* empties them, and they can be changed by hand.

Documents

Documents linked to the Subcontracting Job, one per row, with the rows of the chosen document

All SAP documents linked to the Subcontracting Job, one per row in chronological order, with the link to open them; *Show* filters by document type. Below, in *Document Lines*, the rows of the chosen document with batches, serial numbers and bin locations.

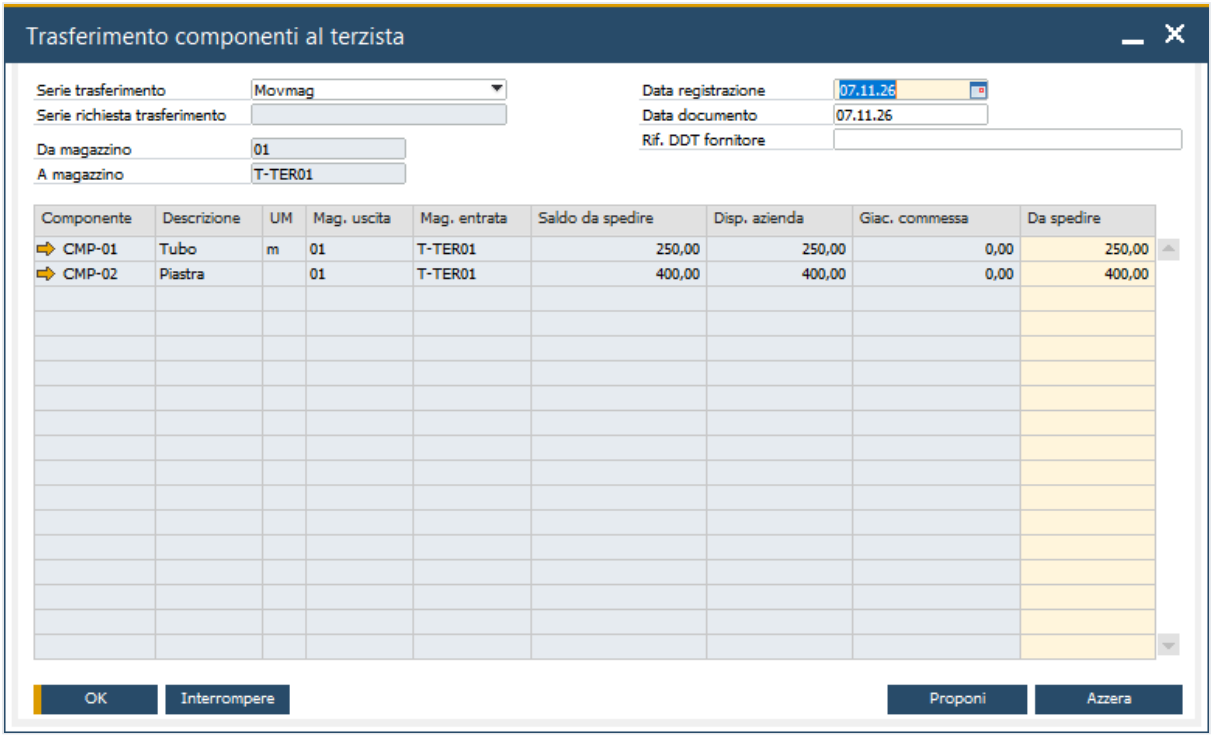

5. Workflow

1. **Subcontracting Job**: vendor, warehouses, products and quantities; *Add*.
2. **Subcontractor Order**: the *Subcontractor Purchase Order* window creates the purchase order, with one row per product and one for each processing; if the order already exists, the button opens it. Later changes to the Subcontracting Job (new or deleted products, quantities, prices, dates) are carried over to the order when saving; rows already received change only in quantity.

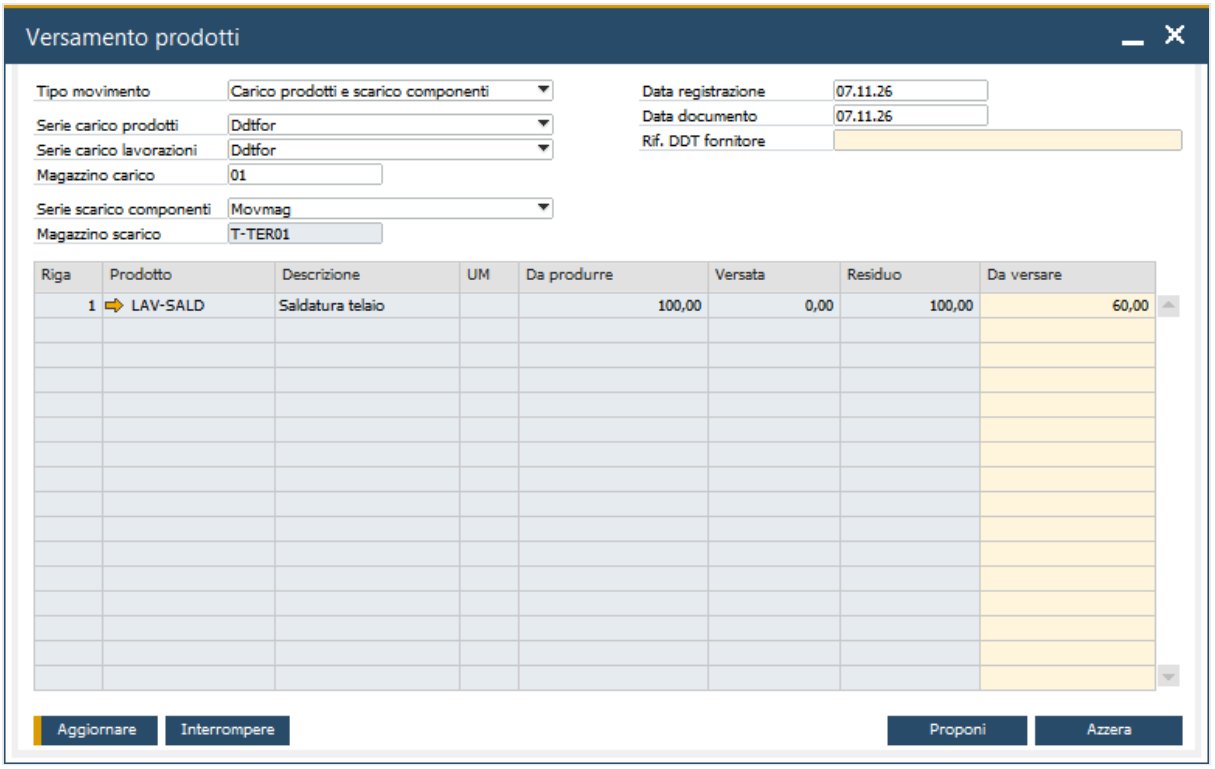

Creation of the purchase order

3. **Send Components**: in the *Component Transfer* window the *To Ship* column proposes the quantity remaining to ship (it can be changed by hand); *OK* creates the inventory transfer to the subcontractor's warehouse. With the related option an inventory transfer request with a pick list is created.

Component Transfer

4. **Receive Products**: in the *Product Receipt* window the *To Receive* column proposes the open quantity (it can be changed by hand) and *Movement Type* chooses between *Receive Products and Issue Components*, *Receive Products Only* and *Issue Components Only*; then *OK*. The following are created: goods receipt PO of the processing and of the products from the purchase order, goods issue of the components from the subcontractor's warehouse, receipts from production for the products from production orders (chapter 6).

Product Receipt

> The product is received at full cost (components + processing); with the “Close the product goods receipt” option the goods receipt is closed and is not invoiced: the processing is invoiced.

If a component to be issued exceeds the stock of the Subcontracting Job at the subcontractor, you are asked whether to issue the remaining stock (Yes / No / Yes to All).

6. Subcontracting from production orders

When some phases of a **production order** are carried out at subcontractors, the add-on creates the Subcontracting Jobs from the rows of the production order. At every product receipt it issues to the production order the components consumed by the subcontractor and, when all external processing has come back, it posts the receipt from production of the finished product.

Setup in SAP

> The external processing is a **non-inventory item** with the **Conto lavoro** (Subcontracting) field = Yes, not an SAP resource: a processing set up as a resource does not appear in the list of production orders.

Where	What you set	In the example
Item Master Data of the processing item	non-inventory item, user field **Conto lavoro** (Subcontracting) = Yes; the **preferred vendor** is the subcontractor proposed in the list	`LAV-SALD` Frame welding, vendor `F-TER01`; `LAV-MONT` Axle assembly, vendor `F-TER02`
Bill of materials of the finished product	one row for each external processing, with the quantity per piece; on the rows of the components to send to the subcontractor the **Lavorazione terzista** (Subcontractor processing) field with the code of the processing and the **Manual** issue method	`CMP-01`, `CMP-02` → `LAV-SALD`; `CMP-03`, `CMP-04` → `LAV-MONT`
Bill of materials of the finished product	**Subcontractor BOM** = Yes if the finished product is complete when all external processing has come back: the add-on posts the receipt from production. With No you post the receipt from production yourself in SAP	`PF-100` = Yes
Warehouse master data of the subcontractor	**Fornitore terzista** (Subcontractor Vendor) field (chapter 4)	`T-TER01` → `F-TER01`; `T-TER02` → `F-TER02`
Subcontractor Processing Prices	price by subcontractor, finished product and processing (order in which the price is searched in chapter 9)	`F-TER01` / `PF-100` / `LAV-SALD` 12.00; `F-TER02` / `PF-100` / `LAV-MONT` 3.50
Configuration, *General* tab (chapter 3)	**Default Price List for Jobs**: the cost price list of the Subcontracting Jobs created from production orders. Without it, *Create Jobs* asks you to enter it and does not create the Subcontracting Jobs	Base Price List

Backflush components linked to the processing are not sent to the subcontractor: the receipt from production issues them from the warehouse of the production order row. The **Reason / warnings** column of the list reports it. The other components of the bill of materials, which have no processing, stay as in any production order.

> **Check when saving the bill of materials.** When you save a bill of materials that has the **Lavorazione terzista** (Subcontractor processing) field filled in, the add-on checks the codes entered. If something is wrong, the warning *"Bill of materials PF-100, field"Lavorazione terzista":"* appears with one point for each case; the bill of materials remains saved.
>
> - Resource: *"LAV-SALD is a resource: the external processing must be created as a non-inventory item with"Conto lavoro" = Yes, and the components must be linked to that code."*
> - Code that is not an item: *"LAV-SALD is not an item."*
> - Item without Conto lavoro: *"Item LAV-SALD does not have"Conto lavoro" = Yes in the item master data."*
> - Processing that is not a row of the bill of materials: *"LAV-SALD is not a row of the bill of materials: the production order will not have the processing row and the subcontracting job cannot be created."*
> - Backflush components: *"Backflush components with processing LAV-SALD: they are not sent to the subcontractor (they must use the manual issue method)."*

Step-by-step example

The finished product `PF-100` Trolley has two external processing steps: the welding of the frame at `F-TER01` «Example Subcontractor 1» and the assembly of the axles at `F-TER02` «Example Subcontractor 2». Each trolley has one frame and two axles. Production order no. 500 is released for 100 trolleys in warehouse `01`:

Row	Item	Quantity	Issue	Lavorazione terzista	Price
1	`LAV-SALD` Frame welding (processing)	100			12.00
2	`CMP-01` Tube (m)	250	Manual	`LAV-SALD`	4.00
3	`CMP-02` Plate	400	Manual	`LAV-SALD`	1.50
4	`LAV-MONT` Axle assembly (processing)	200			3.50
5	`CMP-03` Wheel	400	Manual	`LAV-MONT`	5.00
6	`CMP-04` Pin	200	Manual	`LAV-MONT`	2.00
7	`CMP-05` Screw	1,600	backflush		

Step	SAP document created	Effect on the production order
1. **Subcontracting › Create Jobs from Production Orders**: you select the two rows of production order 500 and press *Create Jobs*	no SAP document: Subcontracting Job 1001 (`F-TER02`, from `01` to `T-TER02`, product `LAV-MONT` 200, bill of materials `CMP-03` 2 and `CMP-04` 1 per piece) and Subcontracting Job 1002 (`F-TER01`, from `01` to `T-TER01`, product `LAV-SALD` 100, bill of materials `CMP-01` 2.5 and `CMP-02` 4 per piece), in the order of the rows in the list	none
2. In each Subcontracting Job press *Subcontractor Order* and confirm the *Subcontractor Purchase Order* window	purchase order to `F-TER01`: `LAV-SALD` 100 × 12.00; purchase order to `F-TER02`: `LAV-MONT` 200 × 3.50	none
3. In each Subcontracting Job press *Send Components* and, with the proposed quantities, *OK*	inventory transfer from `01` to `T-TER01`: `CMP-01` 250, `CMP-02` 400; from `01` to `T-TER02`: `CMP-03` 400, `CMP-04` 200	none
4. 60 frames come back: in Subcontracting Job 1002 press *Receive Products*, in the *Product Receipt* window enter 60 in *To Receive* and press *OK*	goods receipt PO from the order: `LAV-SALD` 60 × 12.00; issue for production from `T-TER01`: `CMP-01` 150, `CMP-02` 240	components of rows 2 and 3 issued; no receipt: the axles are missing, and a message says so (*"Production order 500: the finished product will be received into stock when processing LAV-MONT also comes back."*)
5. 100 axles come back: Subcontracting Job 1001, *Receive Products*, 100 in *To Receive*, *OK*	goods receipt PO `LAV-MONT` 100 × 3.50; issue for production from `T-TER02`: `CMP-03` 200, `CMP-04` 100; receipt from production `PF-100` **50**	60 frames and 100 axles are enough for 50 trolleys: 50 completed; SAP backflushes `CMP-05` 800
6. Another 100 axles come back: Subcontracting Job 1001, *Receive Products*, 100 in *To Receive*, *OK*	goods receipt PO `LAV-MONT` 100; issue for production `CMP-03` 200, `CMP-04` 100; receipt from production `PF-100` **10**	60 completed, the others wait for the frames (*"Production order 500: 10 pieces of the finished product received; the others will be received when processing LAV-SALD also comes back."*); Subcontracting Job 1001 closes by itself
7. The last 40 frames come back: Subcontracting Job 1002, *Receive Products*, 40 in *To Receive*, *OK*	goods receipt PO `LAV-SALD` 40; issue for production `CMP-01` 100, `CMP-02` 160; receipt from production `PF-100` **40**	100 completed; Subcontracting Job 1002 closes by itself. You close the production order yourself in SAP

> The receipt from production is valued at the cost of the external processing per piece: for each processing, components and processing price, multiplied by the quantity per piece. In the example one trolley is worth (2.5 × 4.00 + 4 × 1.50 + 12.00) + 2 × (2 × 5.00 + 1 × 2.00 + 3.50) = 28.00 + 31.00 = **59.00**.

Special cases

- **Several production orders**: the rows with the same vendor and the same return warehouse (*Return Whse* column) go into the same Subcontracting Job, one product per row; with different return warehouses, different Subcontracting Jobs are created.
- **Subcontractor services**: a non-inventory component with **Lavorazione terzista** (Subcontractor processing) (for example a test) becomes a processing of the Subcontracting Job, with one more row in the order to the subcontractor.
- **Subcontractor BOM = No**: the add-on posts the goods receipt of the processing and the issue of the components; you post the receipt from production yourself in SAP, for example after an internal assembly.
- **Receipts from production posted in SAP** on the same production order: the add-on subtracts them, the finished product is not received twice.
- **Interrupted Subcontracting Job**: if you interrupt a Subcontracting Job, the processing goes back to the list and you can create another one.
- **Backflush components**: the backflush components linked to the processing are not sent to the subcontractor; the **Reason / warnings** column reports it.
- **Bill of materials of the Subcontracting Job**: for products from production orders it cannot be changed; you change the processing price (*Proc. Cost* column), which is carried over to the order to the subcontractor when saving. With the *Split the processing cost* option, the *Total Proc. Cost* of the header is split across the products in proportion to the quantity.
- The *Close the product goods receipt* option does not apply to Subcontracting Jobs from production orders: the goods receipt of the processing remains open, to be invoiced.
- **Vendor quotations**: with the *Vendor quotations from production orders* option, *Vendor Quotation* links a quotation row to the row, with its vendor, price and delivery date; the quotation rows not chosen are closed.

Why a production order does not appear in the list

The list shows the processing ready to become a Subcontracting Job. Turn on **Also show rows that are not ready**: the other ones appear too, with the reason and what to do in the **Reason / warnings** column. Rows that are not ready cannot be selected; if you click their selection box, the reason also appears in the status bar.

Reason (example on screen)	What to do
Already in subcontracting job no. 1001.	nothing: open the Subcontracting Job from the *Job* column
LAV-SALD is a resource: the external processing must be created as a non-inventory item with “Conto lavoro” = Yes, and the components must be linked to that code.	create the processing item and enter its code in **Lavorazione terzista** (Subcontractor processing) on the components
The components refer to processing LAV-SALD, which is not an item.	correct **Lavorazione terzista** on the components or create the item
Item LAV-SALD does not have “Conto lavoro” = Yes in the item master data.	set **Conto lavoro** (Subcontracting) = Yes in the item master data

Reason (example on screen)	What to do
The production order has no row for processing LAV-SALD: add it to the production order (or to the product bill of materials).	add the row to the production order, or to the bill of materials for the next production orders
No components to send: on the component rows enter “Lavorazione terzista” = LAV-SALD and the manual issue method.	fill in the components to send, with the Manual issue method
Production order not released: release it in SAP.	release the production order

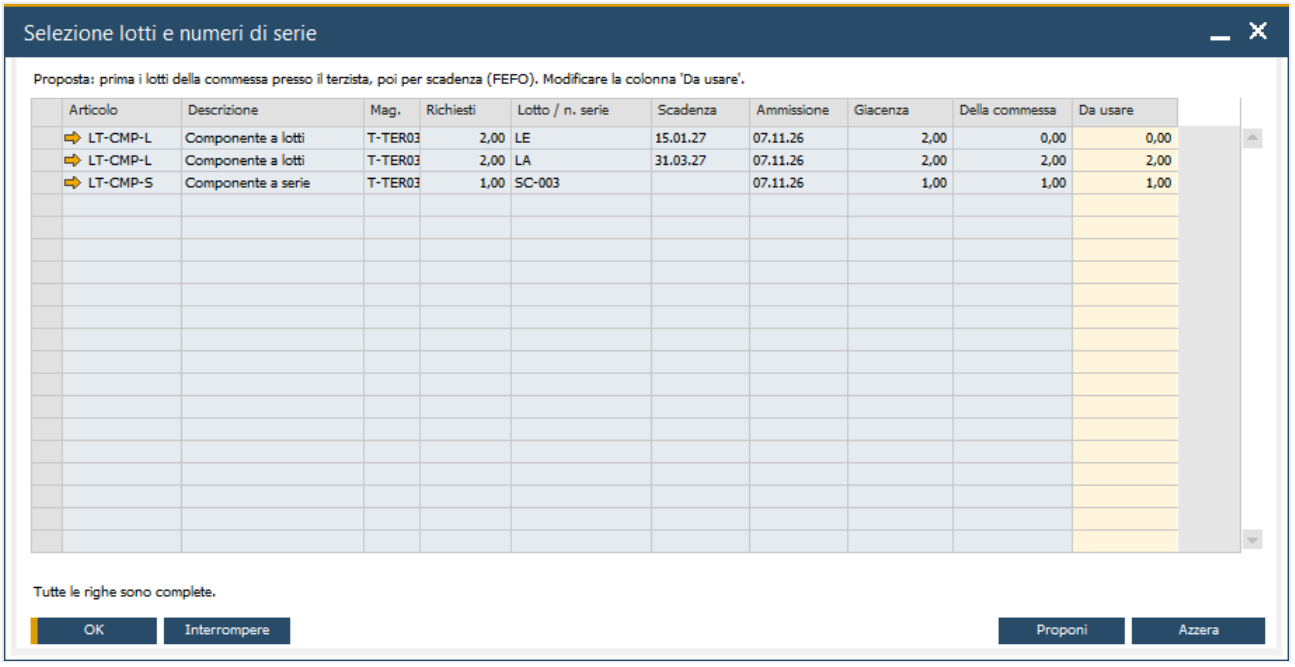

A processing set up as an SAP resource is a frequent cause: the external processing must be created as a non-inventory item with **Conto lavoro** (Subcontracting) = Yes.

On the rows that are ready, the same column gives the warnings that do not prevent selection:

Warning	What to do
Backflush components with this processing: they are not sent to the subcontractor (they must use the manual issue method).	if they must be sent, set the Manual issue method
Enter the vendor.	choose the vendor in the *Vendor* column
Vendor F-TER01 has no linked subcontractor warehouse.	link the subcontractor’s warehouse to the vendor (**Fornitore terzista** (Subcontractor Vendor) field): without it, the Subcontracting Job is not created

7. Batches, serial numbers and bin locations

For transfers, returns, scrap and the issue of components in the product receipt, batches and serial numbers are chosen in a window of the add-on, **before** the documents are created. All documents are then created in a single operation.

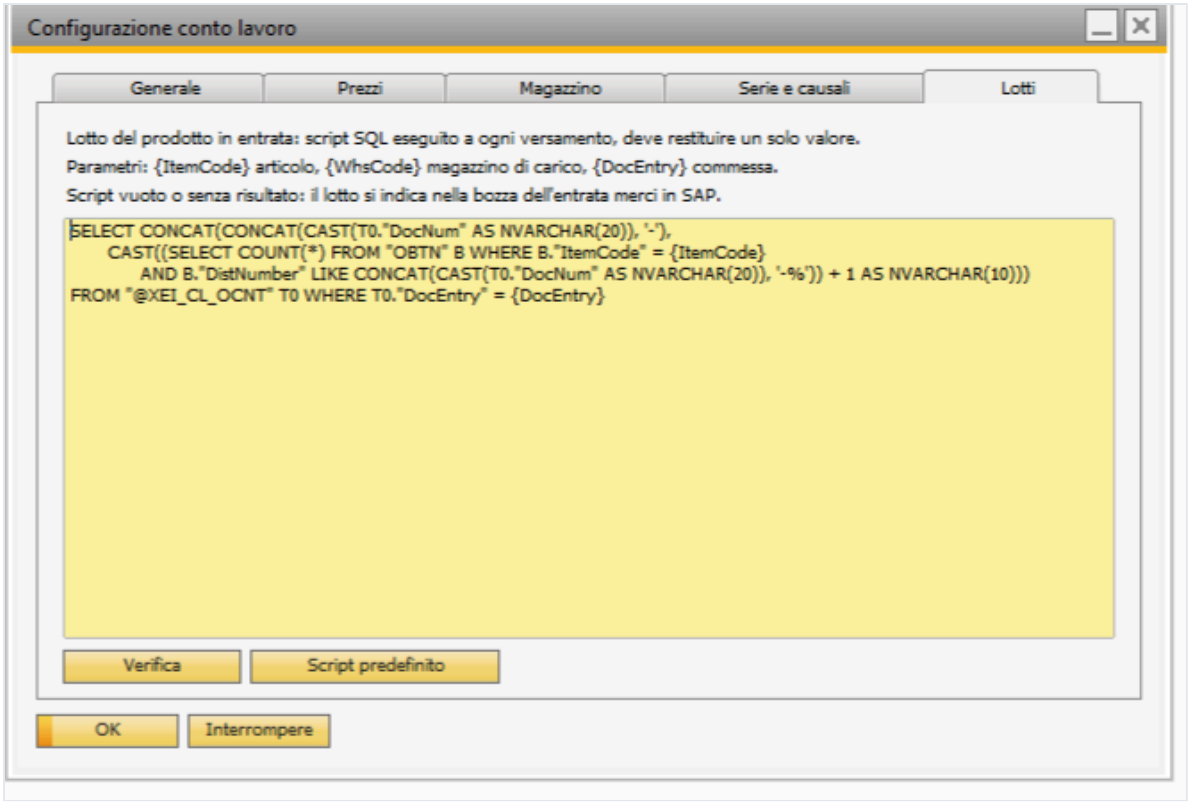

Product receipt: batch LA of the Subcontracting Job is proposed, not batch LE, which expires first but does not belong to the Subcontracting Job

- **Automatic proposal**: from the subcontractor's warehouse (component issue, return, scrap) first the batches **shipped to that Subcontracting Job** ("Of the Job" column, taken from SAP's batch transaction log), then by expiry date (FEFO); from the company's warehouse by expiry date (FEFO).
- **Manual choice**: the "To Use" column can be edited; the quantity is limited to the stock of the batch (net of other rows on the same batch) and to 1 for serial numbers. *Propose* makes the proposal again, *Clear* empties everything. Confirmation is possible only when each row has exactly the requested quantity.
- Only **released** batches and serial numbers are proposed (not locked or not accessible).
- Inventory transfer requests do not move batches: no selection opens for them.

Batch of the incoming product

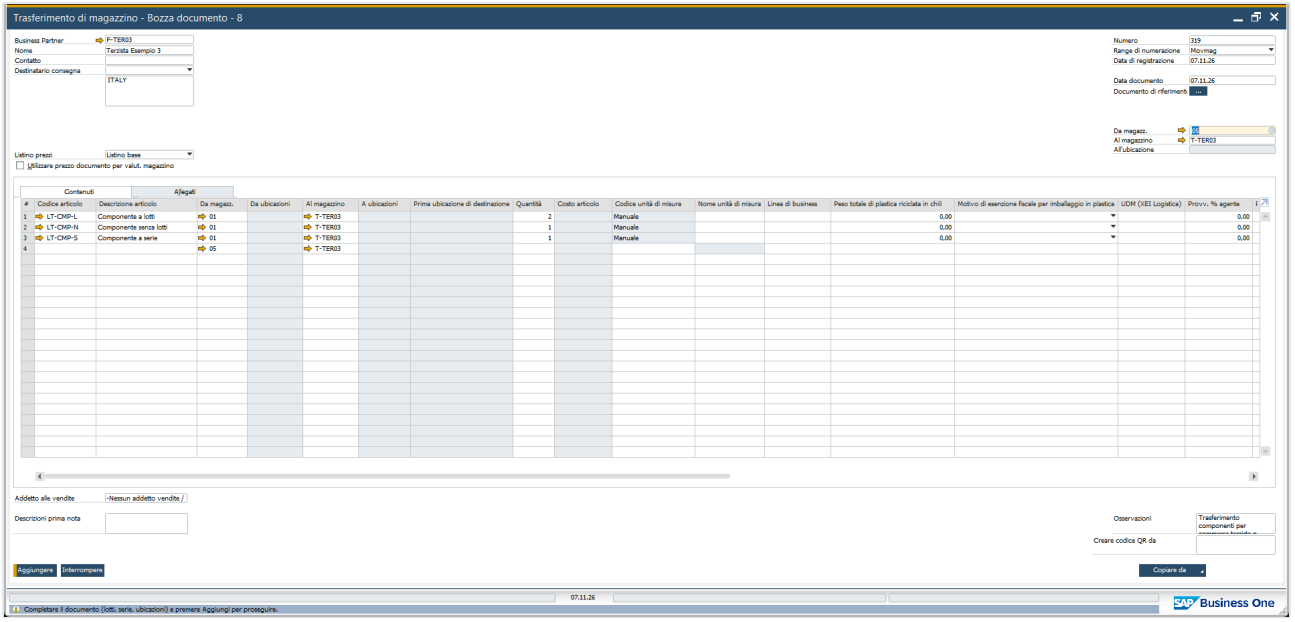

The batch of the received product is calculated by a configurable **SQL script** (Configuration › Batches), with three fixed parameters: `{ItemCode}` item, `{WhsCode}` receiving warehouse, `{DocEntry}` Subcontracting Job. The default script returns the Subcontracting Job number + a sequence number (e.g. `20160256-1`); *Test* runs it with test data. The batch created appears in the message at the end of the product receipt. The same script gives the batch of the finished product of the production order (chapter 6) in the receipt from production. If the finished product is managed by serial numbers, or the script does not return a batch, the product receipt is not posted and a message explains what to do. For serial numbers: **Subcontractor BOM** = No in the bill of materials of the finished product and receipt from production posted in SAP.

Incoming product batch script

Draft documents

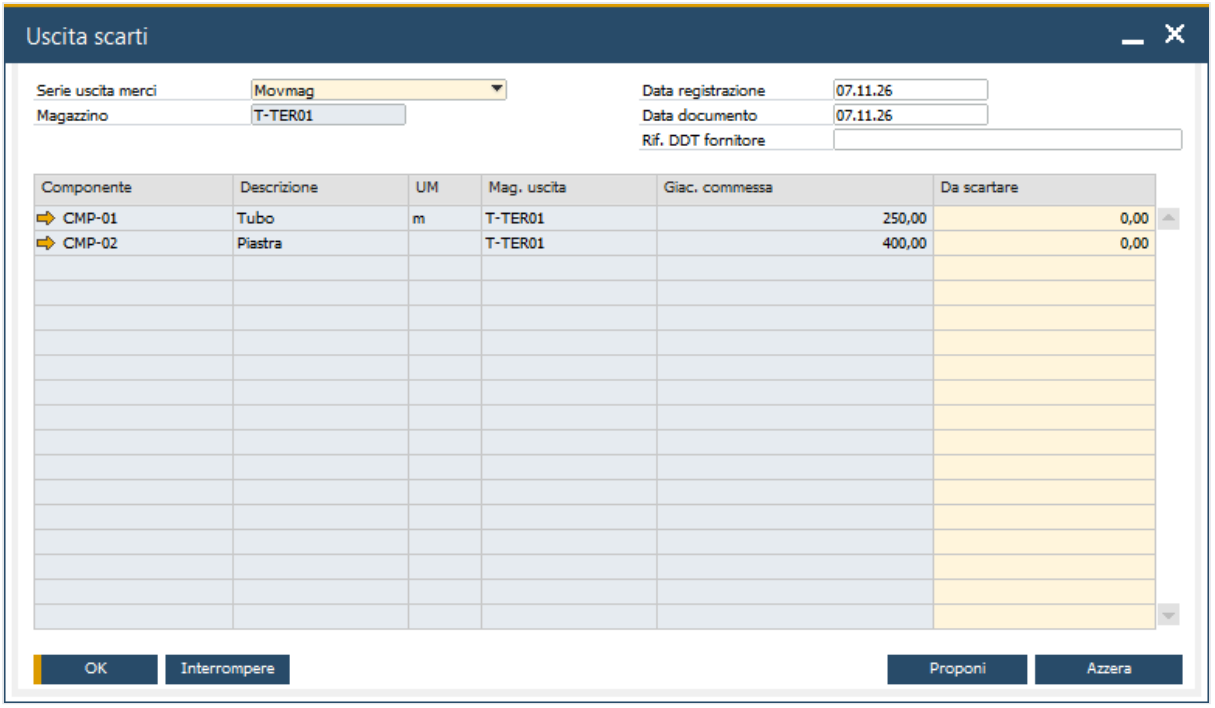

The document is created as a draft, to be completed in the SAP form, with warehouses with **bin locations**, incoming products with **serial numbers**, an empty batch script or one without result, and in the mass transfer. You complete the document and press *Add*: the add-on deletes the draft and continues. On lines with batches or serial numbers to choose, in the draft the bin location is also entered in SAP together with the batches.

Draft document: "Complete the document (batches, serial numbers, bin locations) and press Add to continue"

8. Returns and scrap

- **Returns and Scrap › Return Components from Subcontractor**: quantity in *To Return* (*Propose* = stock of the Subcontracting Job at the subcontractor), then *OK*: transfer from the subcontractor's warehouse to the company's warehouse.
- **Returns and Scrap › Transfer Scrap**: quantity in *To Scrap*; moves the scrap from the subcontractor to a warehouse of your choice.
- **Returns and Scrap › Scrap Issue at Subcontractor**: in the *Scrap Issue* window, goods issue of the scrap directly from the subcontractor's warehouse.

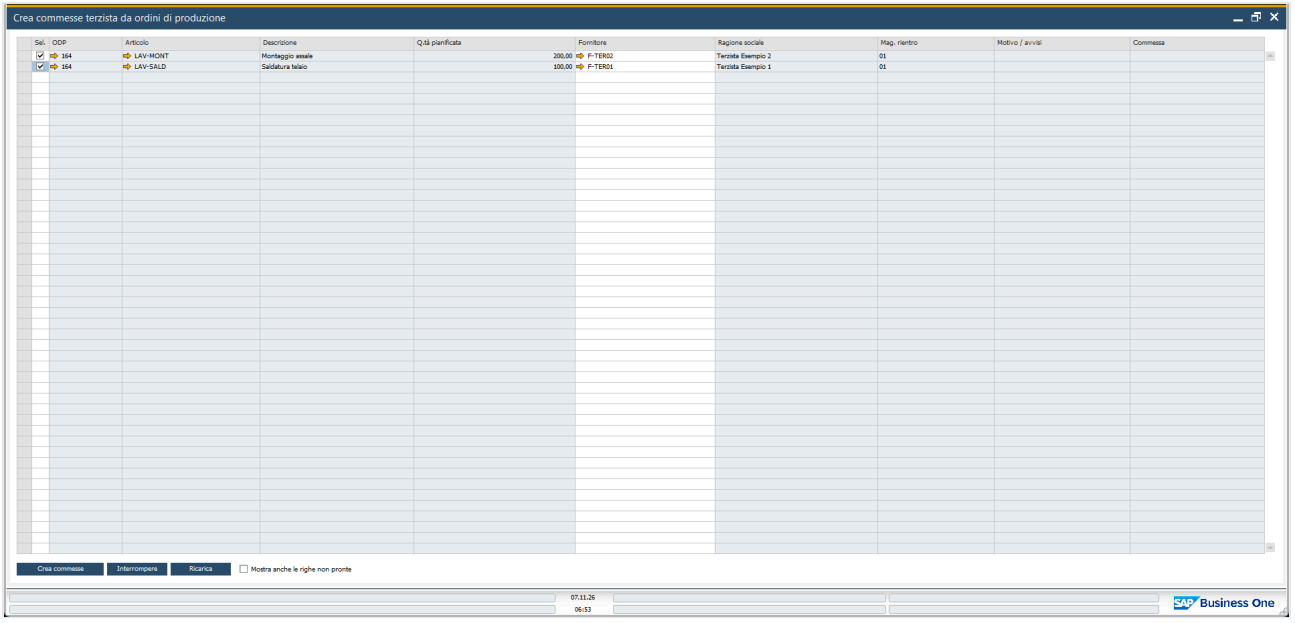

Scrap Issue

Scrapped components go back into the quantity remaining to ship.

9. Service functions

Subcontracting Jobs from production orders

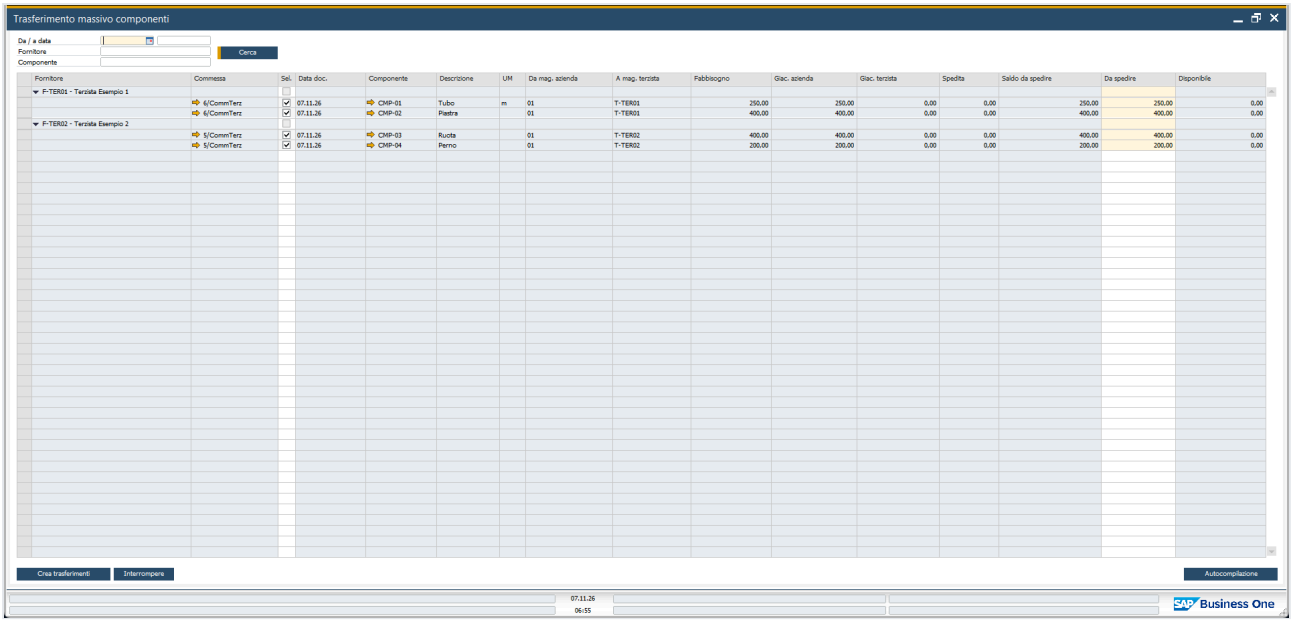

Lists the external processing of released production orders that is ready to become a Subcontracting Job, and creates **one Subcontracting Job per vendor and return warehouse**. With *Also show rows that are not ready* it explains why a processing is not ready. Setup, complete example and special cases in chapter 6.

The two external processing steps of the production order in the example (chapter 6), one per subcontractor

Mass Component Transfer

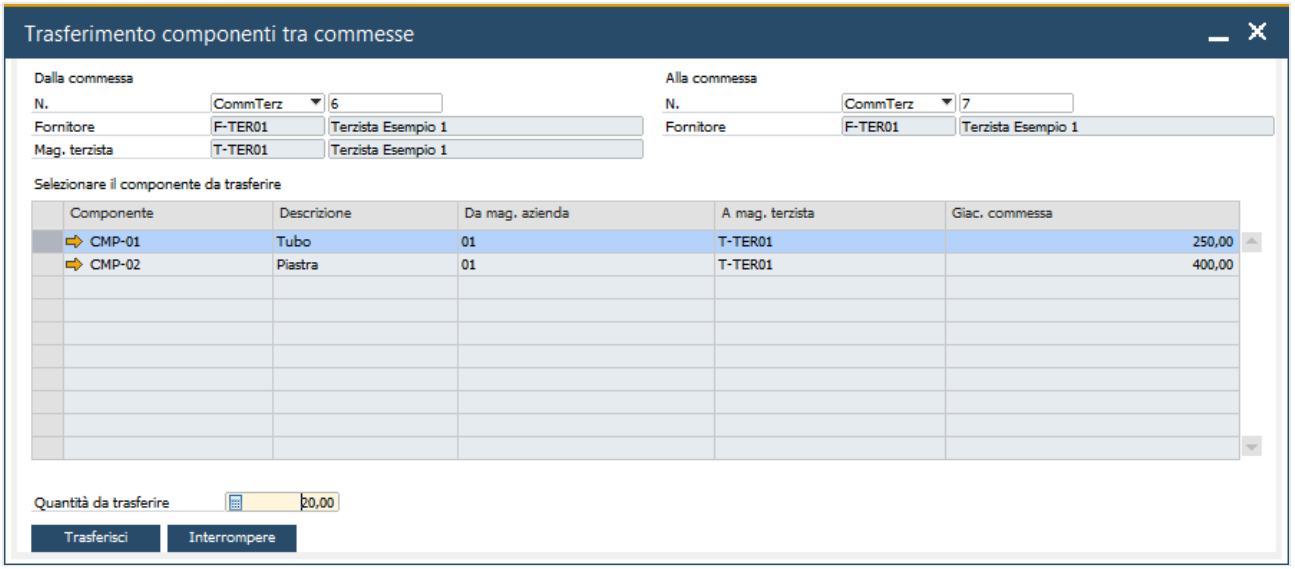

Analyzes the open Subcontracting Jobs (filters by dates, vendor, component) and proposes the components with a quantity remaining to ship, respecting the availability shared among the Subcontracting Jobs if the company blocks negative stock. Creates one transfer per vendor (as a draft if batches or bin locations are needed). Rows with a missing subcontractor warehouse or one equal to the source warehouse are excluded and reported.

Components with a quantity remaining to ship, grouped by vendor and Subcontracting Job

Component Transfer Between Jobs

Moves the stock already at the subcontractor from one Subcontracting Job to another without inventory movements (only a record). For this reason it is possible only between **open** Subcontracting Jobs with the **same subcontractor warehouse**: the list proposes only those; with different warehouses the operation is blocked and the goods must be returned and shipped again. The stock is read again at the moment of confirmation.

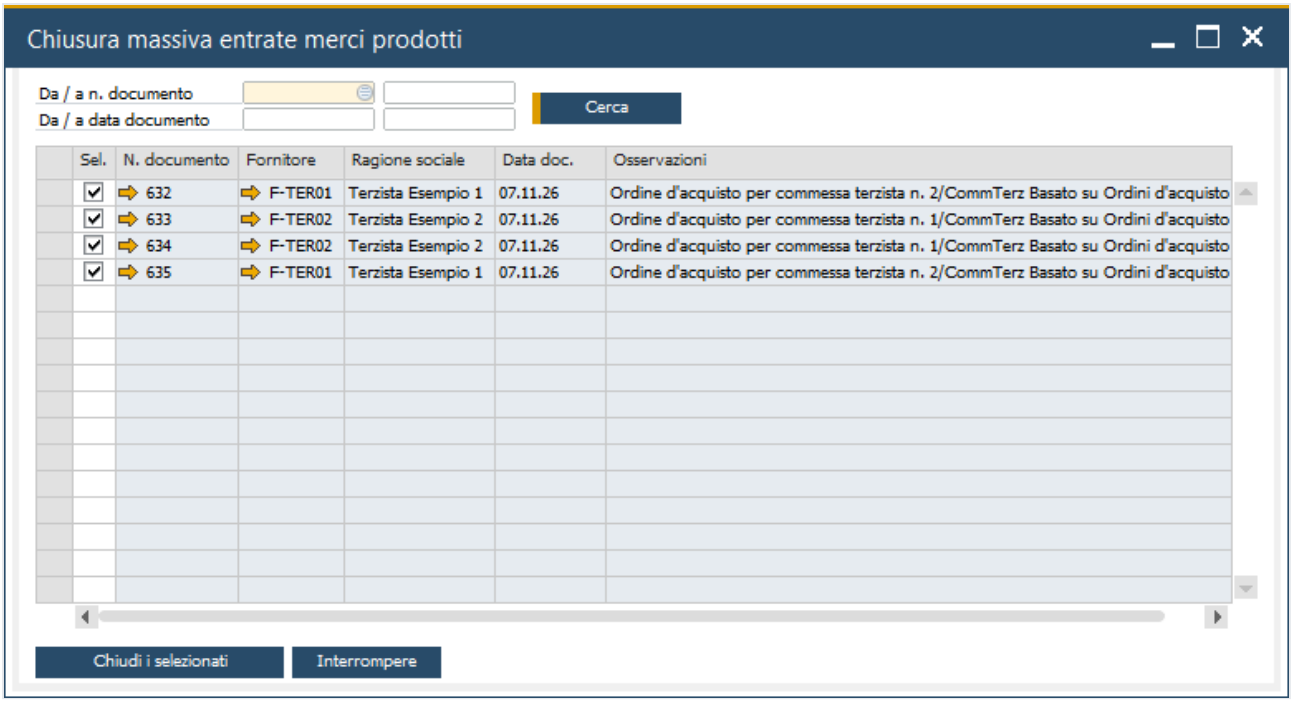

Transfer between Subcontracting Jobs

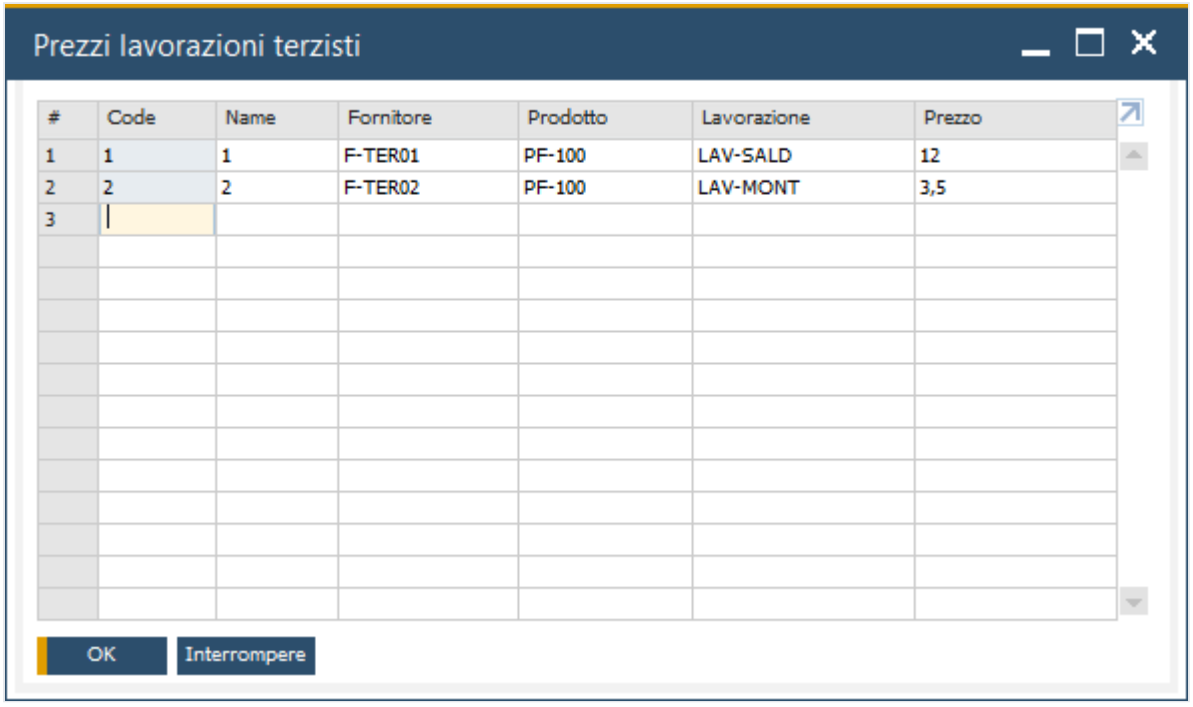

Mass closing of product goods receipts and processing prices

Mass Closing of Product Goods Receipts lists the goods receipts of the products that are still open and closes the chosen ones. *Subcontractor Processing Prices* is the table of processing prices by subcontractor and product.

Order in which the price of a processing is searched: vendor agreements (option, SQL Server only), prices by subcontractor, bill of materials (option), SAP vendor price, price list of the Subcontracting Job.

Goods receipts of the products that are still open

Processing prices by subcontractor and product

10. Data, fields and movement types

Table	Content
`@XEI_CL_OCNT`	Subcontracting Job header (UDO `XEI_CL_COMMESSA`, with series)
`@XEI_CL_CNT1`	products
`@XEI_CL_CNT2`	bill of materials (components and processing)
`@XEI_CL_PRZLAV`	processing prices by subcontractor and product
`@XEI_CL_TRCOMM`	transfers between Subcontracting Jobs

Fields on the SAP tables (prefix `XEI_CL_`):

Field	Tables	Content
`U_XEI_CL_ENTRY`	document rows	Subcontracting Job (DocEntry)
`U_XEI_CL_LINENUM`	document rows	product or bill of materials row
`U_XEI_CL_TYPE`	document rows	movement type (table below)
`U_XEI_CL_TXT`, `U_XEI_CL_OPIT`, `U_XEI_CL_ITEM`, `U_XEI_CL_WKEY`, `U_XEI_CL_ENBL`	document rows	text, reference item and production order, usable quotations
`U_XEI_CL_ICNT`	items	subcontracting item
`U_XEI_CL_TERZF`, `U_XEI_CL_DFTR`	warehouses	subcontractor vendor of the warehouse, default subcontractor warehouse
`U_XEI_CL_DISTTERZ`	bills of materials	Subcontractor BOM (receipt from production from production orders)
`U_XEI_CL_ILAV`	bill of materials and production order rows	processing to which the component belongs

If the company uses them, the add-on also fills in the commercial code, transport reason, freight terms and carrier of the documents.

Type	Document	Meaning
EMP	purchase order, goods receipt PO	product
OAL	purchase order, goods receipt PO	processing
UMC	goods issue (issue for production if from a production order)	consumed components
TSO	inventory transfer or request	components sent to the subcontractor
TSI	inventory transfer	component return
TSS	inventory transfer	scrap transfer

Type	Document	Meaning
UMR	goods issue	scrap at the subcontractor
EPR	receipt from production	finished product of the production order (chapter 6)

Canceled documents are excluded from the calculations and returns are subtracted row by row.

11. Languages

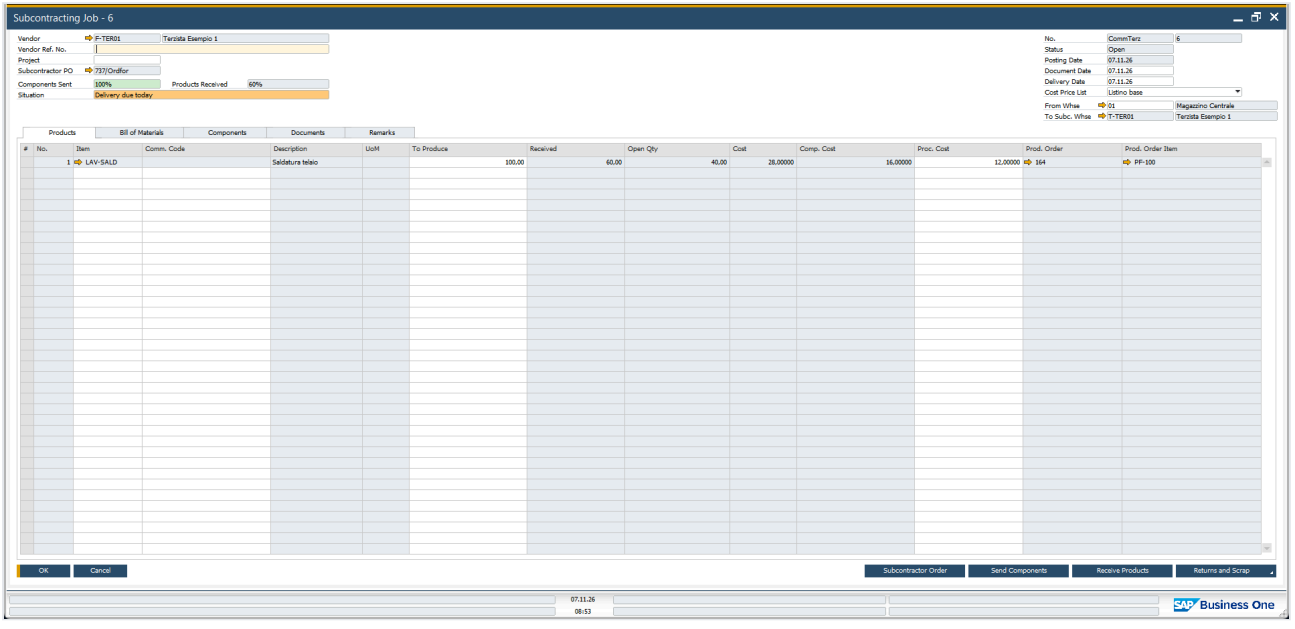

The add-on follows the language of the SAP client. **Italian** (base language), **English**, **German**, **French**, **Spanish** and **Turkish** are available: menus, forms, columns, buttons, messages and remarks of the documents created. With a language that is not provided, Italian is used.

SAP language	Add-on texts	Commessa terzista	Terzista
Italian (Italy)	Italian	Commessa terzista	terzista
English (United States / United Kingdom)	English	Subcontracting Job	subcontractor
German	German	Lohnfertigungsauftrag	Lohnfertiger
French	French	Ordre de sous-traitance	sous-traitant
Spanish (Spain / Latin America)	Spanish	Orden de subcontratación	subcontratista
Turkish	Turkish	Fason iş emri	fasoncu

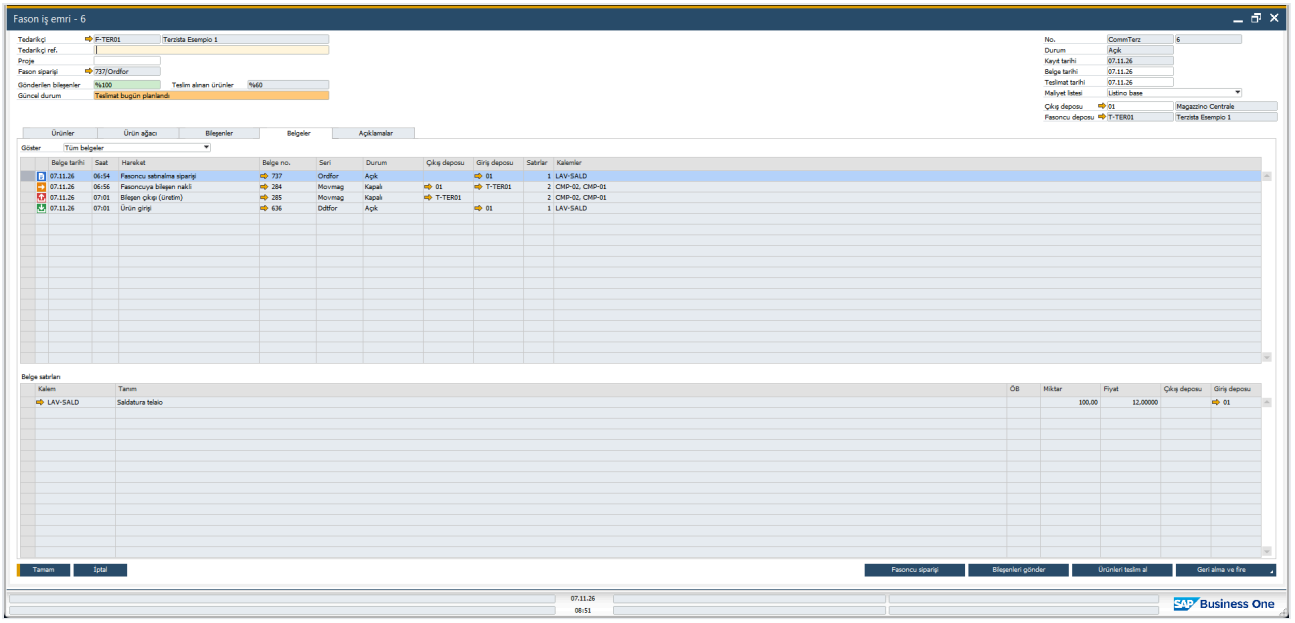

The terms follow those of SAP Business One in the same language (for example *Vendor*, *Posting Date*, *Inventory Transfer*, *Bill of Materials*, *Batch* in English; *Tedarikçi*, *Kayıt tarihi*, *Stok nakli*, *Ürün ağacı*, *Parti* in Turkish).

Changing the language

1. **Administration › Setup › General › Users**, *Display* tab, *Language* field, then *Update*.
2. SAP warns that all open windows will be closed: answer *Yes*.
3. The add-on reloads the texts by itself and recreates the menus in the new language: there is no need to restart it.

Subcontracting Job with the client in English

Documents tab with the client in Turkish

Customizing the texts

Each text can be changed for the individual customer from the **Traduzioni** (Translations) menu of the add-on or with the right mouse button on the forms (*Modifica testo...* (Edit text...), *Testi di questa form...* (Texts of this form...)). The `XEI_TEXTS` authorization is required (superusers always have it). Customizations are kept when the add-on is updated.

Texts saved in the database by SAP remain in Italian, for example the descriptions of the user fields and the title of the *Prezzi lavorazioni terzisti* (Subcontractor Processing Prices) table. The *Informazioni*, *Traduzioni* and *Licenza* items of the framework, with their windows, are in Italian in all languages.
